Berlin K, Guetig D; Piepenbrock C, olek A,

WPI; 2002-371829/40.

Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons diagnosis and prognosis, com from chemically treated DNA.

Claim 12; 56pp + Sequence Listing; 56pp; German.

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-0pG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of cligomers, the degree of methylation is calculated. The method is used:

(i) for diagnosis and/or prognosis of side effects of therapeutic drugs and a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP, s); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABQ13410-RPC sections are of cytosine methylation described in the disclosure of the invention

Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons diagnosis and prognosis, com from chemically treated DNA.

Claim 12; 56pp + Sequence Listing; 56pp; German.

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated Chemically to convert cytosine (C) but not methylated C, to uradil, then part of the genomic cample of DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the rwo classes of oligomers, the degree of methylation is calculated. The method is used:

(i) for diagnosis and/or prognosis of side effects of therapeutic drugs not of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc. particularly by detecting mutations of single nucleotide polymorphisms (SNP'8); and (ii) for differentiation. The method allows the methylation status of many C residues to be determined simultaneously, ABQ19410-ABQ24121 represent genomic DNA sequences used to illustrate the method of the contract investigating cell differentiation. The method allows the methylation abcorder of the contract of the co disclosure of the invention

They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human bone marrow.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzhaimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          83

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ABS45294;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SXXXE
```

The invention relates to a single exon nucleic acid probe (SENP) (1) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification for complements fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (1) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproceinaemia which is associated with coronary heart disease. ABS25011-ABS51005 represent human sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at fip.wipo.int/pub/published_pct_sequences 261 TGGCATCACTGACTCGATGGACGTGAGTCTGGGTGAACTCCTGGAGTTGGTGATGGACAG 2720 Human genome-derived single exon nucleic acid probes useful for analyzing 1; Gaps Human; single exon nucleic acid probe; liver; cirrhosis; hyperlipoproteinaemia; hyperlipidaemia; hypercholesterolaemia; coronary heart disease; ss. Spatially-addressable set of single exon nucleic acid probes, used to measure gene expression in human lung samples.

Claim 4; SEQ ID NO 19867; 634pp; English.

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from thuran lung comprising single exon nucleic acid probes having one of 12014 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 probes. Also included are a microarray comprising the movel set of probes which hybridise at high stringency to a nucleic probes. Also included are a microarray comprising the array with a carry man unua, comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung conjection of detectably labeled nucleic acids derived from human lung conjection of detectably labeled nucleic acids derived from human lung array; identifying exons in a eukaryotic genome, comprising (a) array; identifying exons in a eukaryotic genome, comprising (b) detectably labeled nucleic acids from entaryote lung mRNA, to a single exon probe, labeled nucleic acids from entaryote lung mRNA, to a single exon probe, comprising (a) identifying exons from genomic sequence by the method above and (b) measuring the expression of each of the exons in several comprising (a) identifying exons from genomic sequence by the method above and (b) measuring the expression of each of the exons in several criscus and/or cell types using hybridisation to a single exon to a single exon to microarrays having a probe with the exon, where a common pattern of expression of the exons should be assigned to a single gene, a pertial comprising one of 12011 sequences, mentioned in the specification, or encoded by the probes/open reading frames (ORP). The probes are used for gene expression analysis, and for identifying exons in a gene, particularly using human cannor, chronic obstructive pulmonary disease (ORP), interestitial lung diseases (ILD), familial idiopathic pulmonary diseases such a sating. Created because with the exons such for elected pulmonary percent cuberous sc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2661 TGGCATCACTGACTCGATGGACGTGAGTCTGGGTGAACTCCTGGAGTTGGTGATGGACAG 2720
histiccytosis, lymphangiclelomyomtosis, pulmonary alveolar proteinosis, Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a single exon probe open reading frame of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pcc_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a composition (I) comprising: carriers and immunostimulants; and a polypeptide (II) of a ovarian tumour polypeptide encoded by a polymucleotide (III) having a cDNA sequence (SI) from the 10912 nucleotide sequences as given in ABL/7023 to ABL87934, (III) encoding (II) having a sequence (S2), a T cell population of (II), or antigen presenting cells that express (II). (I) has cytostatic activity. An oligonucleotide (IV) that hybridises to (SI) can be used for detecting ovarian cancer in a patient's biological sample preferably serum or ovarian tissue. The method comprises contacting a biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Composition for therapy and diagnosis of ovarian cancer comprising polypeptide of a ovarian tumor polypeptide, polymuclectide encoding polypeptide, antibody specific to polypeptide or I cell expressing polypeptide.

value and thereby detecting ovarian cancer in the patient, where the amount of polynucleotide hybridising to (IV) is detected preferably by polymerses chain reaction (PCR). (I) comprising (III) and/or [II] is useful for stimulating and/or expanding T cells specific for an ovarian tumour protein comprising contacting T cells with (III) or (II). (III) is useful in design and preparation of ribozyme molecules for inhibiting expression of the tumour polypeptides and proteins in tumour cells, and to isolate a full length gene from a suitable library e.g., a tumour cDNA library using well known techniques
                                                                                                                                                                                                       0; Gaps

New isolated polynucleotide and pancreatic tumor polypeptides, useful for diagnosing, preventing and/or treating cancer, particularly pancreatic

Claim 1; SEQ ID NO 4051; 300pp + Sequence Listing; English.

The invention relates to an isolated polynucleotide (I) comprising: (a) any of a group of over 4000 nucleotide sequences (ABV94628-ABV99145); (b) complements of (a); (c) sequences consisting of at least 20 contiguous residues of (a); (a) sequences that hybridize to (a), under moderately stringent conditions; (e) sequences having at least 75% or 90% identity to (a); or (f) degenerate variants of (a). Polypeptides (ABP68596-

New polynuclectides encoding protease homologs of the G-protein-coupled protease family, useful in identifying agonists and antagonists for diagnosis and treatment of protease mediated disorders.

Disclosure; Col 95-96; 246pp; English.

The invention relates to an isolated human protease mucleic acid molecule comprising a nucleotide sequence of 546 base pairs, one of 268 fully defined in the specification. Also discolsed are production of an isolated polypeptide encoded by the nucleic acid, use of an antibody to detect the mucleic acid, use of an antibody to detect the express the protein from the nucleic acid, use of an antibody to detect the encoded protein in a sample and to modulate its in vivo activity, identifying agents that bind to the protein and identification of a polymucleotide agent that modulates the expression or activity of the nucleic acid, and can be used to identify an agent that modulates the expression or activity of the nucleic acid, and can be used to isolate the protein. The nucleic acid and can be used to isolate the protein. The nucleic acid as well as activity in the context of a biological sample (e.g., blood, as well as activity in the context of a biological sample (e.g., blood, as well as activity in the context of a biological sample caid expression or activity of the nucleic acid. The nucleic as disorder, or is at risk of developing a disease or disorder, associated with aberrant expression or activity of the nucleic acid can be used a subsect of actect naturally-occurring genetic mutations in a protease gene. The nucleic acid can be used to detect naturally-occurring genetic mutations in a protease gene mediated disorders e.g., proliferative, differentiative, deen protease mediated disorders e.g., proliferative, differentiative, developmental or haematopolitic disorders. The nucleic acid can be used a can be used to design ribody as probes, primers, in biological assays, to determine patterns of gene expression, to design ribodyments represents one of the 268 disclosed human G-protein-

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGF) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). (II) the polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in game therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and partners are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polypurcleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIDO at the printed sequences.

The encoded bovine trypsin gene may be expressed recombinantly and is able to cleave zymogens into active drugs, e.g. pro-insulin conversion into insulin. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           821 TCCAAGGCAAACCATTCAATATCACAGTAATCCAAGTCTATGCCCCAACCAGTAATGCTG 880

This sequence encodes a claimed recombinant trypsin. The trypsin is produced by cleavage of a trypsinogen analogue (AAY91925). A wild type broduced by cleavage of a trypsinogen analogue (AAY91925). A wild type broduce trypsinogen was mutated to destroy the trypsin cleavage site. The lys residue present in the leader Sequence of the native bovine trypsinogen protein was mutated to an Asp residue. The vector was constructed such that DNA encoding a (Glu-Nal2) peptide was inserted between the C-terminus of the alpha factor signal and the N-terminus of the trypsinogen analogue leader sequence to improve the yield of the secreted protein. The specification claims an isolated trypsinogen some analogue leader sequence to improve the yield of the sequence having at least two amino acids which are not Lys or Arg. The captured from the recombinant trypsinogen is useful for the characterization of other proteins, and in the manufacture of other recombinant bioproducts, for example to cleave leader sequences from formal recombinant proteins appreciately as fusion proteins. The present method provides for expression of an inactive zymogen form that is soluble and properly folded yet is not activated until after the present from fermentation broth or cell extracts. This is analogue where the leader sequence is modified such that it lacks a trypsin-lake enzyme cleavage site. Specifically the trypsinogen analogues to the present invention lack a lysine or arginine in the N-terminal leader sequence of the prevent auto-activation or activation or activation by endougenous host cell enzymes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 821 TCCAAGGCAAACCATTCAATATCACAGTAATCCAAGTCTATGCCCCAACCAGTAATGCTG 880

The present sequence is the coding sequence for bovine met-phetrypsinogen. Trypsin is a serine protease which cleaves the peptide bond on the carboxy-terminus of basic amino acid residues. Trypsin is synthesised in a slightly longer catalytically inactive form: trypsinogen, which itself is cleaved (leader sequence removed) to give trypsin. The leader sequence of the protein encoded by the present sequence consists of (Asp)4-Lys) and is present at the amino-terminus. The protein encoded by the present sequence has two additional residues at the amino terminus: Net and Phe. Bovine met-phe-trypsinogen is useful for the manufacture of recombinant protein pharmaceuticals. High purity trypsin products are produced by expressing trypsinogen inside a prokaryotic cell which is then isolated and activated to form trypsin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0; Gaps

This gene is expressed in a recombinant host, e.g. E. coli, using plasmid pRMGY. The encoded bowine trypshinogen gene may be expressed recombinantly and is able to cleave zymogens into active drugs, e.g. pro-insulin conversion into insulin. (Updated on 25-MAR-2003 to correct PN field.)

Expression vectors for bovine trypsin and bovine trypsinogen - for cleavage of zymogens into active drugs, e.g. pro-insulin conversion into insulin.

This sequence encodes a trypsinogen analogue. The wild type bovine trypsinogen was mutated to destroy the trypsin cleavage site. The lys residue present in the leader sequence of the native bovine trypsinogen protein was mutated to an Asp residue. The vector was constructed such that DNA encoding a (Glu-Ala)2 peptide was inserted between the C-cerminus of the alpha factor signal and the N-terminus of the trypsinogen analogue leader sequence to improve the yield of the secreted protein. The specification claims an isolated trypsinogen analogue comprising a protein having trypsin activity and a leader sequence having at least two amino acids which are not bys or Arg. A recombinantly produced trypsinogen is also claimed. The trypsin derived from the recombinant trypsinogen is useful for the characterization of other proteins, and in the manufacture of other recombinant bioproducts, for example to cleave the manufacture of other recombinant bioproducts, for example to cleave fusion proteins. The present method provides for expression of an initially as fusion proteins. The present method provides for expression of an initially as clusion proteins. This is accomplished through the expression of a single chain trypsinogen analogue where the leader sequence is modified such that it extracts. This is accomplished through the expression of a single chain analogues of the present invention lack a lyshe or arithin in the N-terminal leader sequence of the protein to prevent auto-activation or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New trypsinogen analog useful for the production of recombinant trypsin has a modified leader sequence not cleavable by trypsin or trypsin-like

Ruben SM, Komatsoulis GA, Birse CE, Moore PA;

WPI; 2001-343795/36 P-PSDB; AAE03821

Isolated nucleic acid molecule encoding a human secreted protein is used in preventing, treating or ameliorating a medical condition.

Claim 1; Page 440-441; 553pp; English.

AAD08283-AAD08355 represent cDNAs corresponding to 23 human secreted protein genes, and AAE03818-AAE03870 represent the proteins they encode. AAE03818-AAE03818-AAE03870 represent the proteins they encode. AAE03818-AAE03818-AAE03870 represent thuman secreted proteins they encode. The secreted proteins and their genes are useful for preventing, treating to rameliorating medical conditions on be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 23 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haemactopicalic disorders, foetal and developmental abnormalities, haemactopicalic disorders (e.g., Alzhelmer's disease, Parkinson's disease), cognitive disorders (e.g., Alzhelmer's disease, Parkinson's disease), cognitive disorders, schizophrenia, asthma, skin disorders (e.g., angiogenic disorders, schizophrenia, asthma, skin disorders, (e.g., angiogenic disorders, kidney disorders, gastrointestinal disorders, angiogenic disorders, endocrine disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to subburn, to maintain organs before transplantation, for supporting cell culture of prinding partners, and in chemotaxis, and can be used as a food additive or preservative to modify storage properties, Antibodies specific for a preservative to modify storage properties and in disorders mentioned above, and in diagnosit immunoassays e.g., and conting and above, and in disorders mentioned above, and in disorders mentyme lanked immunosoperic immunoassay or enzyme lanked immunosoperic immunoassay or enzyme lanked immunosoperic immunoassay or enzyme lanked immunosoperical and protein of the angele and enzyme lanked and protein and protein of the angele and and and present sequence represents a human secreted protein-encoding CDNA of the nvention

The invention relates to an isolated polynuclectide (I) comprising: (a) any of a group of over 4000 nucleotide sequences (ABV94628-ABV99145); (b) complements of (a); (c) sequences consisting of at least 20 contiguous residues of (a); (d) sequences consisting of at least 20 contiguous trained and a sequences having at least 75¢ or 90% identity to (a); or (f) degenerate variants of (a). Polypeptides (ABP68596 to (a) a patient and compositions comprising polypeptides (ABP68596 to an a patient and compositions comprising polypeptides, polynuclectides, and stimulating the polypeptide are useful in treating pancreatic cancer and stimulating an immune response. The polynuclectides can be used as preparation of ribozyme molecules for inhibiting expression of the tumour polypeptides and proteins in the tumour calls, in vaccines and for gene printed specification, but was obtained in electronic format directly from WIPO at fip.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated polynucleotide and pancreatic tumor polypeptides, useful f
diagnosing, preventing and/or treating cancer, particularly pancreatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Lodes MJ, Persing DH, Hepler WT, Jiang Y;

It is used to express Factor IX and Factor VII. cDNA encoding Factor VII can be used in DNA construct which contains a nucleotide sequence encoding a protein which, on activation, has the same biological activity for blood coagulation as Factor IIa. The nucleotide codes at least partially for Factor VII and comprises a sequence encoding a calcium binding domain joined to a scend sequence downstream of this encoding a catalytic domain for the serine protease activity of Factor VIIa. The calcium binding domain comprises a gene encoding Factor VII. IX, X Protein C, prothrombin or Protein S. The construct is used to transfect host cells to produce the protein Nich, on activation, yields Factor VIIa. (Updated on 31-0CT-2002 to add missing OS field.) The invention relates to human prostasin-like enzyme polypeptides and polymentides. The enzyme can be expressed by standard recombinant polymucleotides. The polypeptide, polymucleotide and modulators are useful for treating diseases like metastasis of malignant cells, tumour angiogenesis, inflammation, chronic obstructive pulmonary disease (COPD), angiogenesis, includemention, thronic obstructive pulmonary disease (COPD), particularly viral infection. The prostasin-like enzyme gene provides a therapeutic target of decreasing the enzyme activity, in particular for treating or preventing metastatic cancer. Neurodegenerative diseases include for e.g. prion protein amyloid plaques of Genstmann-Straussler Syndrome, Creutzfeldt-Jakob disease and Scrapie. The agonists and antagonists of the polypeptide may be useful to treat osteoproresis, antagonists of the polypeptide may be useful to treat osteoproresis, paget's disease, degradation of bone implants particularly dental implants. Altered levels of human prostasin-like enzyme activity inhibit the progression of restenosis and atherosclerosis. Anti-human prostasin-like enzyme activity inhibit the progression of restenosis and atherosclerosis. Anti-human prostasin-like enzyme activity in addinning diagnosis of micrometastases, autoimmune lesions and renal failure in blopsy specimens, plasma samples and body fluids. The present sequence represents a human prostasin-like enzyme polynucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       2603 TGCTGGGAGGGATTGGGGGCAGGAGGAGAGAGACAACAAAGGGATGAGATGGCTGGATG 2662

The invention relates to novel serine proteases designated BSSP4 (AABI1700-B11709). The invention also relates to vectors and transformants comprising BSSP4 mucleic acids, relates to vectors and transformants comprising BSSP4 mucleic acids, relates to vectors and transformants comprising BSSP4 mucleic acids, transgenic animals in which the expression level of BSSP4 can be varied, and an mBSSP4 knockout mouse. The invention additionally encompasses anti-BSSP4 antibodies and methods of production of such antibodies, methods of ESSP4 antibodies and methods of production of such antibodies, methods of ESSP4 antibodies are creating the mass of actine proteases. The invention medical conditions. Nucleotides encoding BSSP4 were initially isolated in a human brain cDMA library using degenerate PCR initially isolated in a human brain cDMA library using degenerate PCR initially isolated in a human brain cDMA library using degenerate PCR initially isolated in a human brain conserved regions of serine proteases. The BSSP4 serine proteases and nucleotides encoding them are useful in detecting homologues, mutants and polymorphic variants in biological campers. Blood diseases associated with altered BSSP4 expression levels. Such diseases include Alzheimer's disease, oedema (dropsy), cancer or inflammation of brain, prostate, testis or bone. Sequences AAAG1793 ans AAAG1704 represents cDNA encoding murine conserved and consing mutine conserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2983 TCTATTTTACTTTAATTGCACTTATTTTTATTGATTTTTTCTAATAAAATCCAGTCCTTGT 3042

The invention relates to novel serine proteases designated BSSP4

(AMB11700-B11709), and to nucleic acids encoding them (AAA61695-A61704,
AAA61799). The invention also relates to vectors and transformants
comprising BSSP4 mucleic acids, transgenic and massSex, the comprise of production aciditionally encompasses anti-BSSP4 antibodies and methods
of production of such antibodies, methods of ESSP4 detection using the
arkers for certain medical sease, methods of ESSP4 detection using the
antibodies, and the use of BSSP4 proteins or fragments as diagnostic
markers for certain medical conditions. Nucleotides encoding BSSP4 were
initially isolated in a human brain cDNA library using degenerate PCR
initially isolated in a human brain cDNA library using degenerate PCR
primers (AAA61745-ABA178) based on conserved regions of serine proteases
The BSSP4 serine proteases and nucleotides encoding them are useful in
detecting homologues, mutants and polymorphic variants in biological
cancer of midlemars for diseases associated with altered BSSP4 expression
levels. Such diseases include Alzheimer's disease, oedema (dropsy),
cancer or inflammation of brain, prostate, testis or bone. Sequences
AAA61655-A61703 ans AAA61799 represent oblys encoding murine
preced (massed), and sequence AAA61704 represents cDNA encoding murine
                                                                                                                                                BSSP4; serine protease; human; hBSSP4; mouse; mBSSP4; brain; diagnostic marker; antibody; transgenic animal; Alzheimer's disease; oedema; dropsy; cancer; inflammation; prostate; testis; bone; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Serine protease BSSP4 and antibodies recognizing BSSP4 for assay and diagnosis of diseases in which BSSP4 expression is altered.
                                                                                                          cDNA encoding human serine protease BSSP4 (hBSSP4) SEQ ID NO:5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0.7%; Score 25.2; DB 1; Length 1036; 71.7%; Pred. (CURA-) CURAGEN CORP.

```
The invention relates to an isolated polynucleotide (I) comprising: (a) any of a group of over 4000 nucleotide sequences (ABV94628-ABV99145); (b) complements of (a); (c) sequences consisting of at least 20 contiguous residues of (a); (d) sequences consisting of at least 20 contiguous residues of (a); (d) sequences that hybridize to (a), under moderately stringent conditions; (e) sequences having at least 75% or 90% identity to (a); or (f) degenerate variants of (a). Polypeptides (ABP6859) encoded by (I) and oligomucleotide can be used to detect cancer in a patient and compositions comprising polypeptides, polymecleotides, on the protesting relations and antigen presenting calls expressing the polypeptide are useful in treating pancreatic cancer and stimulating an immune response. The polymecides can be used as propagation of ribozyme molecules for inhibiting expression of the tumour polypeptides and proteins in the tumour colls, in vaccines and for gene contrary contrary contrary contrary former of the tumour colls, in vaccines and for gene and in the deal for this patent did not form part of the contrary contrary contrary contrary. Note the requence date for this patent did not form part of the contrary contrary contrary contrary contrary contrary contrary.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated polynucleotide and pancreatic tumor polypeptides, useful for diagnosing, preventing and/or treating cancer, particularly pancreatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           printed specification, but was obtained in electronic format directly from WIFO at ftp.wipo.int/pub/published_pct_sequences

WoV14a is a prostasin-like protein, and the NOV14a coding sequence localises to chromosome 16. The NOV proteins and coding sequence invention are useful for treating or preventing NOV-associated disorders or in the manufacture of a medicament for treating the disorders, such as cancer, heart disease, inflammation, autoimmune disorders, allergies, blood disorders, AIDS, diabetes, obesity, asthma, 1gA nephropathy, cirrhosis, arthritis, Alzheimer's disease, infections (e.g. bacterial, viral, parasitic), asroke muscular dystrophy, epilepsy, and other wasting disorders associated with chronic diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        450 GGCCACATGACCCCAGCCAGTGACAGTGCAGTGGAGGCCGTTGGGGAAGGAGGCGTTGGC 391

```
The partial factor VII cDNA sequence is produced by joining portions of CDNA clones lambda VII2115 and lambda VII1923. It is used in a DNA construct which contains a nucleotide sequence encoding a protein which, on activation, has the same biological activity for blood coagulation as Factor IIa. The nucleotide codes at least partially for Factor VII and comprises a sequence encoding a calcium binding domain joined to a scend sequence downstream of this encoding a catalytic domain for the serine protease activity of Factor VIIa. The calcium binding domain comprises a gene encoding Factor VII. IX, X Protein C, prothrombin or Protein S. The construct is used to transfect host cells to produce the protein which, on activation, yields Factor VIIa. (Updated on 31-0CT-2002 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Berkner KL, Insley MY, Woodbury RG, Gray CL;

Isolated nucleic acid molecule encoding a human secreted protein is used in preventing, treating or ameliorating a medical condition.

Claim 1; Page 440-441; 553pp; English.

ADD002283-AAD00335 represent cDNAs corresponding to 23 human secreted protein genes, and ABC0380 represent the proteins they encode. AAE0380-AAE0380 represent the proteins they encode. AAE0380-AAE0380 represent human secreted proteins they encode. The secreted proteins and their genes are useful for preventing, treating or amaliorating medical conditions, e.g., by protein or gene therapy. The secreted protein in a sample or by determining the presence of mutations in the protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 23 genes, the new genes. Specific uses are described for each of the 23 genes, the new genes. Specific uses are described for each of the 23 genes, the developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, locatal and developmental abnormalities, heematopoietic disorders, diseases of the immune system, AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, allergies, contrive disorders, schizophrenia, asthma, skin disorders, contrive disorders, schizophrenia, asthma, skin disorders, pregnancy-related disorders, atherosclerosis, cardiovascular disorders, pregnancy-related disorders, endocrine disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proteins can also be used to aid wound healing and epithelial cell proteins can also be used to aid wound healing and epithelial cell proteins to modify storage properties. Antibodies specific for a preservative to modify storage properties. Antibodies specific for a protein of the invention can be used as a food additive or a preservative to modify storage properties. Antibodies specific for a protein of the invention can be used in alleviating symptoms associated

The present invention relates to the isolation of novel human enzyme polypeptides (AAU22915-AAU23814), and the CDNA and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of a wide range of disorders including hyperproliferative disorders (e.g. cancer), immunodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g. carcer), immunodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g. archivitis), neurological disorders (e.g. AIDS) autoimmune disorders (e.g. paemphila), reproductive disorders (e.g. altherosclerosis), blood-related disorders (e.g. paemphila), reproductive disorders (e.g. infertility) and infectious disorders (e.g. Influenca). The polynucleotides of the invention can also be used in gene therapy. AAAS40785-AAA31684 represent circular access encoding for the novel human enzyme polypeptides of the invention. Note: a sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel polypeptides and polynucleotides useful for diagnosing, preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 1352 BP; 238 A; 446 C; 407 G; 261 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 4; SEQ ID NO 311; 1180pp; English.

```

Novel polypeptides and polynucleotides useful as diagnostic reagents to diagnose diseases or disorders associated with aberrant expression or activity of polypeptides, for treating blood clotting disorder, hemophilia.

Claim 1; SEQ ID NO 134; 601pp; English.

The invention relates to isolated nucleic acid molecules and their encoded secreted proceins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, gasts, horses, casts, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a nathological condition or susceptibility to be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunoascabant assays (ELISA). Disorders which are diagnosed or treated include autoimmune companies of the breast or liver, cardiovascular disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. carbovascular disorders e.g. corneal infection, carbovascular disorders e.g. corneal infection, carbovascular disorders e.g. carbovascular disorders e.g. carbovascular disorders e.g. corneal infection, carbovascular disorders e.g. carbovascular disorders e.g. corneal infection, carbovascular disorders e.g. carbovascular disorders e.g. carbovascular disorders e.g. carbovascular disorders e.g. carbovascular disorders e.g. carbovascular disorders e.g. carbovascular disorders e.g. carbovascular disorders e.g. carbovascular disorders e.g. carbovascular disorders e.g. carbovascular disorders e.g. carbovascular disorders e.g. carbovascular disorders e.g. carbovascul

Novel isolated human ovarian related polypeptide useful for diagnosis/treatment of disorders of ovary and breast such as neoplastic disorders, infectious diseases, inflammatory diseases, and reproductive disorders

Claim 1; SEQ ID NO 56; 524pp; English.

The invention relates to isolated ovarian related polypeptide (ovarian antigan) comprising a sequence at least 90% identical to a sequence elected from a polypeptide fragment, domain, epitope or full length protein of a sequence (81) appearing as ABG6029-ABG60296 having contain or a variant, allelic variant or species homologue of 81. Also included are the CDNA clones encoding the proteins of 81. Si, an anti-S1 antibody and the CDNA are useful for diagnosing, preventing, treating or ameliorating a medical condition in mammalian subject respicially diseases and/or disorders of the ovary and/or breast such as neoplastic disorders (such as ovarian Krukenberg tumour and cancer), infectious diseases (e.g., mastitis, opphoritis), inflammatory diseases (e.g., mastitis, opphoritis), inflammatory diseases (e.g., mastitis, system disorders (fasted disorders (sichle cell anaemia), autoimmune disorders (systemic lupus erythematosus, rheumatoid arthitis), blood-related disorders (sichle cell anaemia), respiratory disorders, urinary system disorders (arrhythmias), respiratory disorders, musculoskeletal system disorders, neural activity and

The present invention relates to the isolation of novel human enzyme polypeptides (AAU22915-AAU23814), and the cDNA and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of exidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the diagnosis, transferances, prevention and/or prognosis of a wide range of diagnosis, transferances of the invention are useful in the diagnosis, transferances of the invention are useful in the clasment prevention and/or prognosis of a wide range of disorders including hyperproliferative disorders (e.g. cancer), continuities, neurological disorders (e.g. Alzhaimer's disease), metabolic disorders (e.g. phenylketonuria), inflammatory disorders (e.g. athma), cardiovascular disorders (e.g. atherosclerosis), blood-related disorders (e.g. unfluences). The polymucleotides of the infectious disorders (e.g. Influences). The polymucleotides of the invention can also be used in gene therapy. AAS40785-AAS41684 represent cDNA sequences encoding for the novel human enzyme polympoptides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly trom WIPO at fitp.wipo.int/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel polypeptides and polynucleotides useful for diagnosing, preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 4; SEQ ID NO 847; 1180pp; English.

Novel polypeptides and polynucleotides useful as diagnostic reagents the diagnose diseases or disorders associated with aberrant expression or activity of polypeptides, for treating blood clotting disorder, hemophilia.

# Claim 1; SEQ ID NO 135; 601pp; English.

The invention relates to isolated nucleic acid molecules and their concoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or amalicitate a medical condition in e.g. humans, mice, rabbits, grats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunosorbant assays immunoassays e.g. radioimmunoassays or enzyme linked immunosorbant assays (ELSA). Disorders which are diagnosed or treated include autoimmune diseases e.g. the breast or liver, cardiovascular disorders e.g. carbital isorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. carbital isorders e.g. nervous system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corhaal infection carbot used to aid wound healths and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to repenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, ocfactors and other nutritional components. The present The Sequence Trees and the nutritional components. The present The

The clone was isolated from a foctal lung library. Amplification of DNA4318 (chromosome 16) was association with tumour formation or growth. Antagonists (e.g. antibodies) directed against PRO343 may have utility in cancer therapy. The invention identifies 14 genes (see AAX87254-67) that are amplified in the genome of tumour cells. Such amplification is expected to be sasociated with overexpression of the gene product and to contribute to tumorigenesis. The encoded proteins (see AAX06477-90) may be useful targets for the diagnosis and/or treatment (including prevention) of certain cancers, and may act as predictors of the prognosis of tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antibody against proteins expressed in neoplastic cells, useful for tumor diagnosis and treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Roy MA;

cDNA encoding novel polypeptide PRO343.

03-OCT-2000 (first entry)

```
AAX52213-74 encode secreted and transmembrane human proteins, and are obtained from cDNA libraries, prepared from fetal lung, fetal kidney, fetal brain, fetal liver and fetal retina. The encoded polypeptides have specific uses based on their homology to known polypeptides, e.g. PRO210 and PRO217 can be used for disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions (e.g. entercoclitis, Zollinger-Ellison syndrome, gastrointestinal ulceration and congenital microvillus atrophy), skin diseases associated with abnormal keratinocyte differentiation (e.g. poriasis, epithelial cancers such as lung squamous cell carcinoma of the prolases related to growth or survival of nerve cells including Parkinson's disease, Alzhaimer's disease, ALS, neuropathies or cancer. PRO265 can be used as for fibromodulin, e.g. for reducing dermal carring. PRO264 can be used as a tari-thrombotic agent, PRO287 polypeptides and portions may be used as an anti-thrombotic agent, PRO287 polypeptides and portions may be used for treatment of Usher Syndrome or Atrophia areata; PRO29 can be used as an anti-thrombotic agent, PRO287 polypeptides and portions may can be used for treatment of Usher Syndrome or Atrophia areata; PRO317 can be used for treatment of Usher Syndrome or Atrophia areata; PRO317 can be used for treatment of Usher Syndrome or Atrophia erepair; PRO317 can be used for treatment of Usher Kidney, uterus, endometrium, processels, or related tissue, e.g. in the heart of genital tract
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  44; Indels 0; Gaps

The invention relates to a novel nucleic acid encoding a PRO polypeptide. The polypeptides and polymucleotides of the invention may be useful as research tools and as therapeutics for treating entercoditis, Zollinger-Blison syndrome, gastrointestinal ulceration, psoriasis, cancer, Parkinson's disease, Alzheimer's disease, ALS, neuropathies, dermal scarting and wound healing, nerve repair, thrombosis, bone and/or cartilage formation, angiogenesis, asthma, thrombosis, bone and/or sclerosis, inflammatory disorders, atherosclerosis, cardiac injury, infertility, premature aging, ALDS, diabetes complications and stroke. The molecules may also be utilised during gene therapy procedures and transgenic animal production. The current sequence is that of the human ö 2983 ICTAITITACTITAATIGCACTIAITITITATIGATITITICIAATAAAATCCAGICCTIGT 3042 1272 irrigigiananaaiginaangarririahaggiarrigiaaccongcodacaratorr 0; Gaps DB 1; Length 1378; Sequence 1378 BP; 235 A; 461 C; 412 G; 270 T; 0 U; 0 Other; 44; Indels 3043 TITITIAAAAAGACTITAAAATTATTAATTTCTCT 3077 0; Mismatches 0.7%; Score 24.6; 1 53.7%; Pred. Isolated nucleic acid useful for e.g., treating pathological disorders encodes a secreted or transmembrane protein.

# Claim 2, Fig 97; 473pp; English.

The invention relates to human PRO polypeptides (secreted or transmembrane polypeptides) and the polymucleotides encoding them. The PRO polypeptides and polynucleotides can be used in treating pathological disorders and tumours, in therapeutic treatment of cardiac insufficiency disorders and in therapeutic treatment of disorders involving protein secretion by the pancreas, including diabetes. They can also be used in treating disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions, and skin diseasés associated with abnormal keratinocyte differentiation (e.g., psoriases, epithelial cancers such as lung squamous call carcinoma, epidermoid carcinoma of the vulva and gliomas). The sequences can be used as molecular markers for protein electrophoresis purposes and can be utilised in protein-

New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO245 or PRO1868, useful in molecular biology, chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy.

The present invention relates to the isolation of novel human secreted and transmembrane proteins (PRO polypeptides), and the polynucleotide sequences are useful in molecular biology, as hybridisation probes, in chromsome and gene mapping, in generating antisense RNA and DNA, and in gene therapy. The polynucleotide sequences may also be used in preparing PRO polypeptides by recombinant techniques, and in generating either transgenic animals oknock-out animals which, in turn, are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or

New transmembrane polypeptides and nucleic acids encoding the polypeptides, useful in gene therapy, in chromosome identification, chromosome markers, in generating probes and in tissue typing.

# Claim 2; Fig 97; 484pp; English.

The invention relates to an isolated nucleic acid with at least 80% nucleic acid sequence identity to a nucleotide sequence encoding one of a secreted/transmembrane polypeptides, or PRO polypeptides or encoding a PRO protein extracellular domain. Also included are a vector comprising the PRO nucleic acid, a host cell comprising the vector, producing a PRO polypeptide (by culturing the PRO polypeptide for the expression of the PRO polypeptide, and recovering the PRO polypeptide from the cell culture), an isolated PRO polypeptide (having at least 80% sequence identity to: (

```
cc a) an amino acid sequence selected from the 61 PRO proteins; (b) an amino acid sequence encoded by a nucleic acid molecule deposited with an ATCC cumber (detailed in the specification); or (c) an extracellular domain of a PRO polypeptide or to a PRO polypeptide lacking its associated signal peptide), a chimaeric molecule computating a PRO polypeptide of fused to a heterologous amino acid sequence, an anti-PRO antibody, detecting a process or PRO1868 in a sample euspected of containing the polypeptide, correctly a process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or process or proces
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1272 TITIGIGIATAFAAHGITFAAFGATTITFAFAGGTAFTTGFAACCCTGCCCACATATCTT 1331

The invention describes a new isolated nucleic acid molecule comprising
the full length coding sequence of the DNA deposited with the American
Type Culture Collection (e.g. ArCC Deposit No. 209228), or a sequence
with at least 80% identity to a DNA encoding a RNO polypeptide comprising
any of 61 sequences having 164.1119 amino acids fully defined in the
competification. The RNO polypeptides or polymodicatides are useful as
plarmaceuticals, diagnostics, biosensors or bioreactors. These are
particularly useful for detecting or treating e.g. Parkinson's disease,
compair, collateral blood vessel formation, cancers (e.g. colorectal
cancer), haemorrhage for reduce risk for haemorrhage), rheumatoid
carthritis, diabetes, cirrhosis of the liver, librosis of the lungs,
restenosis, dermal fibrotic conditions (e.g. keloids or scarring),
restenosis, dermal fibrotic conditions (e.g. keloids or scarring),
reterility in mammals (e.g. humans, dogs, cats, cattle, horses, sheep,
pigs, goats, or rabbits) The RNO polypeptides are also useful
as molecular weight markers, or for chromosome identification. The RNO
geness are useful as hybridisation probes, or for screening libraries of
human cDNA, genomic DNA or mRNA. The RNO genes may also be used in gene
therapy, particularly for replacing a defective gene. This sequence
therapy, particularly for replacing a defective gene. This sequence
                                                                                                                                                                                                     New genes and secreted and transmembrane polypeptides (e.g. PRO245 or PRO335), useful for treating or diagnosing e.g. Alzheimer's disease, cancers, hemorrhage, rheumatoid arthritis, diabetes, cirrhosis, ischemia

Also include are the nucleic acids encoding the PRO polypeptides and nucleic acids are useful in diagnosing or treating of concerns, host calls and anti-PRO antibodies. The PRO polypeptides and nucleic acids are useful in diagnosing or treating abnormal keratingoryce differentiation, skin diseases associated with abnormal keratingoryce differentiation, e.g. posiasis or epithelial cancers such as aquamous cell carcinoma, Alzheimer's disease, Parkinson's disease, anyotrophic lateral solerosis, inflammatory disease, e.g. creamers such as aquamous cell carcinoma, Alzheimer's disease, e.g. creamers such as action and repair and associated therapies or polypeptides are also useful for wound repair and associated therapies conformed with re-growth of tissue. The nucleotide sequences may be used as hybridisation probes in chromosome and gene mapping, or in generating antisense RNA and DNA. PRO nucleic acids are also useful in the describement and screening of therapeutically useful reagents, for chromosome identification, and the in turn are useful reagents, for chromosome identification, and created in pene therapy, and as molecules and nucleic acid and encodes may be used in assays for PRO polypeptides and uncleic acid acid molecules are also useful or mechalism are also useful the archiberacial percentage or acid molecules are also useful or recom
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New PRO polypeptides and nucleic acid molecules, useful in diagnosing or treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, cancer, AIDS, Alzheimer's disease or Parkinson's

Novel secreted and transmembrane polypeptides and polynucleotides encoding them useful for treating abnormal bleeding involved in gynecological diseases, skin diseases and neurodegenerative diseases.

Claim 3; Fig 97; 478pp; English.

```
The invention relates to an isolated PRO polypeptide. PR0317 is useful in diagnosing or treating abnormal bleeding involved in gynecological diseases e.g. to avoid or lessen the need for hysterectomy. PR0317 may also be useful as an agent that affects and pr0317 is useful controlled to be useful as an agent that affects angiogenesis and PR0317 lis useful controlled to treating disorders.

CC PR0211 and PR0217 polypeptides are useful for treating disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions, skin diseases. CC associated with abnormal keratinocyte differentiation (e.g. psoriasis). PR0187 polypeptide is useful for treating parkinson's disease. Telated to uncontrolled cell growth, e.g. cancer. PR0319 polypeptide plays a regulatory role in the blood coagulation cascade. PR0246 polypeptides which serves as tumour specific antigens may be explorated as therapeutic targets for anti-tumour drugs. PR0269 polypeptide is useful as an antithromboric agent with reduced risk for haemorrhage as compared with heparin. PR0317 polypeptide is useful in portion have therapeutic applications in wound healing and tissue repair. PR034 polypeptides are useful for treating asthma, rheumatoid arthritis, portion have therapeutic applications in wound healing and tissue repair. PR034 polypeptides are useful for treating asthma, rheumatoid arthritis, portions and multiple sclerosis. The polypeptide and its nucleic acid immunohistochemical staining and/or assay of sample fluids. Anti-PR0 are useful in diagnostic assays for PR0 e.g. detecting its error purification of PR0 from recombinant cell culture or natural sources. The polyment setting a human secreted/transmenter process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2983 TCTATITITACTITAATIGCACTIATITITATIGATTITITCTAATAAAATCCAGTCCTIGI 3042

                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bloactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. The PRO polypeptides or polymucleotides are also useful as pharmaceuticals, diagnostics, biosensors or bioreactors, for detecting or treating e.g. hyperplasia, concers (e.g. those involving solid tumours), ischaemia, coronary arterial disease, polycystic kidney disease, chronic or acute renal failuxe, or inflammatory responses (e.g. asthma, rheumatoid arthritis, psoriasis or multiple sclerosis) in mammals. The PRO genes may also be used in agene therapy, particularly for replacing a defective gene. The sequences presented in ABXS6017.ABXS6378 are the genes encoding, the primers amplifying and the probes detecting the PRO
                                                                                                                                                                                                                                                                                                       New secreted and transmembrane PRO polypeptides (e.g. PRO533 or PRO245) and genes encoding them, useful for detecting or treating e.g. hyperplasia, endometriosis, cancers, ischemia, coronary arterial disease or inflammations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0; Gaps

The invention relates to sixty one nucleic acids encoding PRO
polypeptides (Secreted and transmembrane). The polynucleotide is useful
in molecular biology, including uses as hybridisation probes, in
chromosome and gene mapping, in generating antisense RNA and DNA, and in
chromosome and gene mapping, in generating antisense RNA and DNA, and in
gene therapy. The polynucleotide may also be used in preparing PRO
polypeptides by recombinant techniques, and in generating either
transgenic animals or knock-out animals which, in turn, are useful in the
transgenic animals or knock-out animals which, in turn, are useful in the
chevelopment and screening of therapeutically useful reagents. The PRO
polypeptide or the antibody is used in preparing a medicament for
treating a condition responsive to the polypeptide or antibody, such as
mucosal lesions e.g. ulcers and enterocolitis, skin disease e.g.
poriasis, cancer e.g. lung cancer and colon cancer, nerve cell disease
e.g. Alzheimer's disease and Parkinson's disease, Usher syndrome,
e.g. Alzheimer dispublicatis, inflammatory disease e.g. suthma and
rheumatorid arthritis, isochaemia, and in various diagnostic assays. The
present sequence represents an cDNA which encodes a PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1272 TTTTGTGTATATAAAGGTTAATGATTTTTATAGGTATTTGTAACCCTGCCCACATATCTT 1331

The invention relates to an isolated, secreted and transmembrane polypeptide, termed PRO polypeptide. The polypeptide is useful for identifying agonists or antagonists of the polypeptide, for preparing variants of the polypeptide, as molecular weight markers for preparing cariants of the polypeptide, as molecular weight markers for protein electrophoresis purpose and the nucleic acid is useful for recombinantly agent. PRO is useful in assays to identify other proteins or molecules involved in binding interaction. The nucleic acid is useful as therapeutic antisense RNA and DNA, in the preparation of PRO polypeptide, for generating transgenic animals or knockout animals which in turn are useful in the development and screening of therapeutically useful reagents, to construct hybridisation probes for mapping the gene which encodes the PRO and for the genetic analysis of individuals with genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel secreted and transmembrane polypeptide for modulating biological activity of cell expressing the polypeptide, identifying agonists or antagonists of polypeptide, and as molecular weight markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ashkenazi A, Botstein D, Desnoyers L, Eaton DL, Ferrara N; Filvaroff E, Fong S, Gao W, Gerber H, Gerritsen ME, Goddard A; Godowski PJ, Grimaldi JC, Gurney AL, Hillan KJ, Kljavin IJ; Mather JP, Paoni NF, Roy MA, Stewart TA, Tumas D; Williams PM, Wood WI;

disorders, in gene therapy, for chromosome identification, as chromosome marker, and for generating probes for polymerase chain reaction (PCR).

Northern analysis, Southern analysis and Western analysis. PRO antibody is useful in diagnostic assays for PRO, e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO antibody is useful for the preparation of medicament for treating conditions which is responsive to the PRO polypeptide or anti-PRO conditions which is responsive to the PRO polypeptide or anti-PRO conditions which is responsive to the PRO polypeptide or anti-PRO conditions which is responsive to the prolypeptide and the modelet exid is useful for tissue typing. The polypeptide and the modelet exid is useful for tissue typing. The polypeptide and the modelet exid is useful for tissue typing. The polypeptide and the modelet exid is useful for tissue typing tumour growth, enhances vacclast permeability and immune response, for inducing regeneration of auditory hair cells and for response, for inducing regeneration of auditory hair cells and for response, such as sports injuries and arthritis. The present sequence represents cDNA encoding a human secreted and transmembrane PRO

        Georgeed and transmembrane). The PRO polypoptides and mucleic acids are useful in diagnosing or treating entercoclitis, gastrointestinal useful in diagnosing or treating entercoclitis, gastrointestinal ulceration, skin disease associated with abnormal keratinocyte differentiation, sign disease, associated with abnormal keratinocyte differentiation, and profile associated with abnormal keratinocyte disease, parkinson's disease, amyotrophic actionamy, Alzheimer's disease, Parkinson's disease, amyotrophic atteral sclerosis, inflammatory diseases, eg. rheumatoid arthritis, asthma or multiple sclerosis, organ failure, atherosclerosis, cancer, injury, infertility, birth defects, premature aging, AIDS, cancer, injury, infertility, birth defects, premature aging, AIDS, cancer, also useful for wound repair and associated therapies concerned with regrowth of tissue. The PRO polypeptides and mucleic acid molecules are also useful in gene therapy, and as molecular weight markers for protein electrophoresis purposes. The anti-PRO antibodies may be used in recombinant cell culture or natural sources. This sequence encodes a cover the natural sources. This sequence encodes a

Claim 2; Fig 97; 467pp; English.

The invention relates to an isolated secreted and transmembrane PRO polypeptides are useful for modulating biological activity of a cell, in diagnosing or treating abnormal bleeding involved in gynaecological diseases e.g. to avoid or lessen the need for hysterectomy, for treating angiogenesis, tumour, coronary isohaemic condition, disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions, skin diseases associated with abnormal keratinocyte amountation (e.g. psoriasis), Parkinson's disease, Alzheimer's differentiation (e.g. psoriasis), Parkinson's disease, Alzheimer's disease, amyotrophic lateral scherosis (ALS), neuropathies, disease related to uncontrolled cell growth (e.g. cancer), blood coagulation cascade disorders, neurodegenerative disease, thrombosis, haemorinage, endommetrial bleeding, wound healing, tissue repair, asthma, rheumatoid arthritis, multiple sclerosis. Nucleic acid encoding PRO polypeptides are useful in molecular biology including uses as hybridisation probes and in the generating transganic animals or knockout animals. The PRO antibodies are useful for immunolistochemical staining and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sour expense. and transmembrane PRO polypeptide

Novel isolated native PRO polypeptide useful for treating Parkinson's disease, enterocolitis, Zollinger-Ellison syndrome gastrointestinal P-PSDB; ADB29468.

ulceration, Alzheimer's disease, amyotrophic lateral sclerosis, Usher syndrome.

Claim 2; Fig 97; 469pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise and then uncleic acid encoding them. The PRO polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptides are useful bloadive molecule to a cell sepressing a PRO polypeptides are useful conformation and for modulating the bloadive molecular conformation and maintenance of a cell expressing PRO polypeptides. PRO polypeptides are also useful for treating disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions, skin diseases associated with abnormal keratinocyte differentiation (e.g. peoriasis) Parkinson's disease, halveing PRO polypeptides. PRO polypeptides are also useful for treating diseases associated with abnormal keratinocyte differentiation (e.g. peoriasis) Parkinson's disease, amyotrophic lateral solerosis (ALS), neuropathies and differentiation (e.g. peoriasis) Parkinson's disease, amyotrophic lateral solerosis (ALS), neuropathies and diseases any polypeptides also serves as tumour specific antigers which may be exploided as therepeutic targets for anti-tumour drugs, and are also infection. The PRO polypeptides can be also used in assays to determine the capture of the proposition and propositions and part of the proposition and propositions are solered in assays to determine the capture of the propositions affect the expression of mithering other PRO sexpeptides and their portions affect the expression of mithering other proposes, as the properties are useful in molecular biology including uses as hybridisation probes for conducting the protein and gene mapping in the generating rob properties, so probe person in the development and sort the generating of propositions affect the expression of midividuals which are useful in the development and sort the generating for properties of propositions are useful in the development and sort process as which

Claim 2; SEQ ID NO 262; 471pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the mucleic acid encoding them. The Polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bloactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a bloactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing a PRO polypeptides are also useful for reating disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal classes, amyotrophic lateral sclerosis (ALS), neuropathies and differentiation (e.g. psociasts), Parkinson's disease, Alzhedmer's diseases, amyotrophic lateral sclerosis (ALS), neuropathies and addifferentiation (e.g. psociasts), Parkinson's disease, Alzhedmer's diseases, amyotrophic lateral sclerosis (ALS), neuropathies and cancer. PRO polypeptides also serves as tumour specific antigens which may be exploited as therapeutic targets for anti-tumour drugs, and are also

```
comployed therapeutically in vivo for lessening the effects of viral infection. The PRO polypeptides can be also used in assays to determine attit thes a role in neurodegenerative diseases or their reversal, as an attithrombotic agent with reduced risk for haemorrhage as compared with heparin, in treating other PRO-associated disorders, in modulating the reduced risk for haemorrhage as compared with heparin, in treating angiogenesis, and may also have an effect on kidney tissue. PRO polypeptides and their portions affect the expression of consolate which have a role in apoptosis. The polymucleotides are useful in molecular biology including uses as hybridisation probes for CDNA library to isolate the full-length PRO CDNA or to isolate other CDNA; in molecular angionist, in the generation of antisense RNA and DNA, for preparing PRO polypeptides, for generating transgemic animals or knockout animals which are useful in the development and screening of the reapeutically useful requested as as well as for recombinantly expensively the propertied expressing the protein and for chromosome identification. The proteins are useful as molecular marker for protein electrophoresis purposes, as the respectic agents, for screening compounds to identify those that mimic of angonists, the polymucleotides and proteins are useful for tissue typing PRO etc. Generally for replacing of PRO etc. Gagonists). The polymucleotides and proteins are useful in diagnostic assays for PRO etc. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from cissue the protein and for affinity purification of PRO from cells, tissues or serum and for affinity purification of PRO from the effect of the protein and and protein and defective gene and any also be used in gene therapy, particularly for replacing a defective gene. The invarious protein and serve and proteins are useful in section of polyment of the protein and protein and protein and protein and any serve and any serve and any serve and any serve
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1272 TTTTGTGTATATAAAIGTTAATGATTTTTATAGGTATTTGTAACCCTGCCCACATATCTT 1331

Claim 2; Fig 97; 476pp; English.

The invention relates to an isolated nucleic acid molecule comprising a sequence with at least 80% identity to: (a) a nucleotide expearing as sequence with at least 80% identity to: (a) a nucleotide sequences having 50.4053bp (10.1867) and transmembrane protein) polypeptides papearing as AB032756-AB032816; or (b) any of 61 nucleotide sequences having 50.4053bp (11) defined in the specification; or the full length coding sequence of any these 61 nucleotide sequences. Also included are the isolated PRO oplypeptide (lacking its associated signal peptide), a vector comprising the nucleotide signal peptide), a vector comprising the nucleotic acid molecule, a host cell comprising the vector (used to produce the PRO polypeptide), a chimmeric molecule comprising the PRO polypeptide fused to a heterologous amino acid sequence, an anti-PRO antibody, detecting PRO245 or PRO1868 polypeptide and modulating at least one biological activity of a cell expressing the PRO245 or PRO1868 polypeptide. The PRO polypeptides or polypeptide and modulating at least one biological activity of a cell expressing the PRO245 or PRO1868 polypeptide. The PRO polypeptides or polymercleotides are useful as pharmaceuticals, diagnostics, biosensors or ploreactors. These are particularly useful for diagnosing or treating corporation matterns, particularly, birth defects, premature aging, malignancy increations, Partinson's diseases, Alzheimer's disease, or AIDS in mammals. These are also useful for modulating cholesterol uptake in the body, and in wound healing or tissue repair. The PRO polypeptides are also useful as weight markers, or for chromosome identification. The PRO genes are useful as hybridisation probes, or for screening alpharmace is a cDNA encoding a PRO plypeptide are also useful as proprised or therapy, generic DNA, genening a PRO polypeptide are also useful as proprised or therapy, served and in gene therapy.

```

The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polymucleotides encoding them. The PRO polypeptides and polymucleotides can be used in diagnosing or treating abnormal bleeding involved in gynaecological diseases e.g. to avoid or lessen the need for hysterectomy. They can also be used in treating coronary ischaemic conditions, disorders associated with the Novel secreted and transmembrane PRO polypeptides and polynucleotides encoding them, useful for treating abnormal bleeding involved in gynecological diseases, skin diseases and neurodegenerative diseases. Claim 2; Fig 97; 475pp; English.

New genes encoding for secreted and transmembrane PRO polypeptides, useful for treating e.g. cardiac insufficiency disorders, wounds, cancers, obesity, diabetes, hyperinsulinemia, hypoinsulinemia, or arthritis.

Claim 2; SEQ ID NO 262; 476pp; English.

The invention discloses isolated PRO secreted/transmenbrane polypeptides and the nutcleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide. for linking a bloactive molecule to a call expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a bloactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide are useful for modulating the biological activity of a cell. PRO polypeptide or the PRO polypeptide are useful for modulating the biological activity protection and conference. The PRO polypeptide or the protection of cells, modulating the proliferation of central as pharmaceuticals, diagnostics, blosensors or polymolocides are useful for simulating mypertrophy of menaral heart, inhibiting vascular encothelial growth factor (VEGP) stimulated proliferation of central activity of the proliferation of central activity associate enhancing the survival or proliferation of crimulated T-lymphocytes, enhancing the survival or proliferation of crimulated T-lymphocytes, enhancing the survival or proliferation of crimulated plucase or PRA upeak, inducing proliferation and/or refulle modulating glucose or PRA upeak, inducing proliferation and/or cells, modulating proliferation or crimilated choracovers. In particular, these are useful for the cells, modulating proliferation or crimilated in survival or particular in the action of chonacovers. In particular, these are useful for cells, modulating proliferation of chonacovers. In particular, these are useful for centing or treating cardiac insufficiency disorders, wounds, cancerous refunding by more propersion of genes which have a role in cell death, me polymolecular polypeptides, for generation and or knockout animals with generation of genetic analysis of individuals with generations are useful in cells cardial as molecular are useful in the development and undown, for p

# Claim 2; SEQ ID NO 262; 479pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a

cc del expressing RRO polypeptides. RPO polypeptides are also useful for treating disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal diseases associated with abnormal Keratinocyte (diseases, amycrophic lateral sclerosis (ALS), neuropathies and adiseases, amycrophic lateral sclerosis (ALS), neuropathies and adiseases, amycrophic lateral sclerosis (ALS), neuropathies and additionally, disease related to uncontrolled cell growth, e.g. cancer. PRO polypeptides also serves as tumour specific antigens which may be explored a therapeutic targets for anti-tumour faruge, and are also employed therapeutically in vivo for lessening the effects of viral cinfection. The PRO polypeptides can be also used in assays to determine if it has a role in neurodegenerative diseases or their reversal, as an antithrombotic agent with reduced risk for haemorrhage as compared with chepatin, in treating or cher PRO-appropries, and may also have an effect on kidney clister. PRO polypeptides and their portions affect the expression of cissue. PRO polypeptides, for an effect on kidney genes which have a role in appotosis. The polymuclocides are useful in molecular biology including uses as hybridiaation probes for cDNA, in consome and gene mapping, in the generation of antisense RNA and DNA, chomosome and gene mapping, in the generation respection and for the genetic animals which are useful in the development and screening of therapeutically useful reagents, as probes and for the genetic animals which are useful in the development and screening of the PRO polypeptide (agonists) or protein electrophoresis as the reagentic assays for screening compounds to identify those that mimic contistes and proteins are useful in the BRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (agonists) or prevent meanuples are useful in gene therapy, par invention.

The invention relates to human PRO polypeptides and the polynucleotides encoding them. The polypeptides and polynucleotides are used for treating diseases related to growth or survival of nerve cells such as Parkinson's disease, Alzheimer's disease, amyotrophic lateral sclerosis (ALS) and neuropathies, diseases related to uncontrolled cell growth such as cancer, viral infections, Usher's syndrome, haemorrhage, entercoolitis, 2011inger billison syndrome, gastrointestinal ulceration, congenital microvillus atrophy, skin diseases such as psoriasis and epithelial encencer, endometrial bleeding, anglogenesis, isonamic conditions, asthma, rheumatoid arrhritis, multiple sclerosis, inflammatory diseases, atherosclerosis, cardiac injury, infertility, birth defects, premature also useful in chromosome and gene mapping. This sequence represents a human PRO polynucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Botstein D, Desnoyers L, Eaton DL, Ferrara N; Fong S, Gao W, Gerber H, Gerriteen ME, Goddard A; Grimaldi JC, Gurney AL, Hillan KJ, Kljavin IJ; an J, Paoni NF, Roy MA, Stewart TA, Tumas D;

New secreted and transmembrane PRO polypeptides e.g. PRO187, which is a member of the epidermal growth factor-8 (EGF-8) family of proteins, useful for treating cancer.

## Claim 2; SEQ ID NO 262; 471pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO polypeptide, for linking at least one biological activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides.

for treating disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions, skin diseases associated with abnormal keratinocyte differentiation (e.g. peoriasis) Parkinson's disease, Alzheimer's diseases, amyotrophic lateral sclerosis (ALS), neuropathies and additionally, disease related to uncontrolled cell growth, e.g. cancer. PRO polypeptides also serves as tumour specific antigens which may be exploited as therapeutic targets for anti-tumour drugs, and are also employed therapeutic targets for anti-tumour drugs, and are also employed therapeutic targets for anti-tumour drugs, and are also employed therapeutic targets for anti-tumour drugs, and are also employed therapeutically in vivo for lessening the effects of viral content of the same ar role in neurodegenerative diseases or their reversal, as an it in treating other PRO-associated disorders, in medulating endometrial bleeding andiogeness, and may also have an effect on kidney content and properties and thair portions affect the expression of endometrial bleeding andiogeness, and may also have an effect on kidney to endometrial bleeding andiogeness, and may also have an effect on kidney to endometrial bleeding andiogeness, and thair portions and game mapping. The polymucleotides are useful in moreous and game mapping, in the generation of antisense RNa and DNA, to isolate the full-length PRO cDNA or to isolate other companing of the protein and for chromosome and game mapping, in the generation of antisense RNa and DNA, to consolate the full and proteins are useful in the generation and for cerominals with genetic disorders as well as protein are useful or expression in specific correspentic agents, for screening compounds to identify those that mimic correlations and or an endome and electrophoresis growed the PRO polypeptide (angonists) or prevent the effect of the PRO polypeptide (angonists) or prevent the effect of the PRO polypeptide same useful for immundiscondering and or

Ashkenazi A, Botstein D, Desnoyers L, Eaton DL, Ferrara N; Filvaroff E, Fong S, Gao W, Gerber H, Gerritsen ME, Goddard A, Godowski PJ, Grimaldi JC, Gurney AJ, Hillan KJ, Kljavin IJ; Mather JP, Ban J, Paoni NF, Roy MA, Stewart TA, Tumas D; Williams PM, Wood WI;

WPI; 2003-521802/49. P-PSDB; ADA13152. New secreted and transmembrane PRO polypeptides, useful for treating cancer, skin disorders, neurodegenerative diseases, and for lessening the effects of viral infection.

### Claim 2; SEQ ID NO 262; 473pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise and the nucleic acid encoding them. The polypeptides can be used to raise bloadies that specifically bind to the PRO polypeptide, for linking a bloactive molecule to a call expressing a PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for Inhing a collocative molecule to a call expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a call expressing a PRO polypeptides. The PRO polypeptide antibodies are useful for modulating the biological activity of a call expressing a Minh the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions, skin diseases associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal diseases, amyotrophic lateral sclerosis (ALS), neuropathies and additionally, disease related to uncontrolled call growth, e.g. cancer. Completed as last parametric targets for anti-tumour drugs, and are also exploited as therapeutic targets for anti-tumour drugs, and are also exploited as therapeutic targets for anti-tumour drugs, and are also employed therapeutically in vivo for lessening the effects of viral infection. The PRO polypeptides can be also used in assays to determine the manufactural production and any algority in the genes which have a role in neurodegenesis, and may also have an effect on kidney tissue. PRO polypeptides and their portions affect the expression of condomerrial bloeding angiogenesis, and may also have an effect of molecular biology including uses as hybridisation probes for copy, to issue the full-length PRO copy or tesolate the full-length PRO copy or tesolate the full-length PRO copy or tesolate the full-length PRO copy or tesolate the full-length PRO polypeptides, for generation of antisense RNA and DNA croisolate call and and ge

```
of individuals with genetic disorders as well as for recombinantly argressing the protein and for chromosome identification. The proceins are useful as molecular marker for protein electrophoresis purposes, as therapeutic agents, for screening compounds to identify those that minic polypeptide (agonists) or prevent the effect of the RRO mildolypeptide (antagonists) or prevent the effect of the RRO polypeptide (antagonists). The polymucleotides and proteins are useful for tissue typing. RRO antibodies are useful for immunohistochemical staining and/or assay for RRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from used in gene therapy, particularly for replacing a defective gene. The sequence presented is a gene encoding a RRO polynucleotide of the
                                                                                                                                                                                                                                                                                                                                                                               2983 TCTATTTTACTTTAATTGCACTTATTTTTATTGATTTTTCTAATAAATCCAGTCCTTGT 3042

Homo sapiens. 23-JAN-2003. 7-SEP-1997 28-OCT-1997 29-OCT-1997 29-OCT-1997 29-OCT-1997 ADA17366; 28-0CT-1 29-0CT-1 28-OCT-1 RESULT 62 ADA17366 à The invention discloses isolated PRO secreted/transmembrane polypeptides and the mucleis card encoding them. The polypeptides can be used to raise and the mucleis card encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide. For linking a to loadtive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide are useful confidence to a cell expressing a PRO polypeptide. The PRO polypeptide are useful confidence to a cell expressing a PRO polypeptide. The PRO polypeptide are useful confidence to a cell expressing a PRO polypeptide. The PRO polypeptide are useful confidence to a cell expressing PRO polypeptide. PRO polypeptide are as a law one can accompanies that a cell expressing properties are useful for treating diseases associated with the preservation and maintenance of gastrointestual mucosa and the repair of accel properties and are associated with the preservation and maintenance of gastrointestual mucosa and the repair of accel gastrointestual mucosa at umour specific antigens which may be differentiation (e.g. psoriasis), Parkinson's disease, Albreimer's diseases amyortrophic lateral sclerosis (ALS), neuropathics and careful and additionally, disease related to uncontrolled cell growth e.g. cancer. PRO polypeptides also serves as tumour specific antigens which may be exploited as therapeutically in vivo for lessening the effect on kidney in the capetide can be also used in assays to decemine of the parkin, in treating other PRO sesociated disorders, in which have a role in neurodegenerative diseases on their reversal, as an antithrombotic agent with have a role in apoptosis. The generation of antisens RNA and DNA, chromosome and gene mapping in the generation of antisens RNA and DNA, chromosome and gene mapping in the generation of antisens RNA and DNA chromosome and gene mapping in the generation of antisens RNA and DNA chromosome and gene mapping in the generation of antisens RNA and DNA chromosome and gene mapping in the generation of an DB 1; Length 1378; Query Match 0.7%; Score 24.6; DB 1; Length 13° Best Local Similarity 53.7%; Pred. No. 26; Matches 51; Conservative 0; Mismatches 44; Indels

P-PSDB; ADA17367.

New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO245 or PRO1868, useful in molecular biology, chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy.

Claim 2; SEQ ID NO 262; 475pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to rais

antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protesh and for modulating at a teast one biological activity of a cell. PRO polypeptides are useful car detecting other PRO polypeptides in a sample and for linking a coll expressing a PRO polypeptide. The PRO polypeptides are also useful concerned modernie to a cell expressing a PRO polypeptides are also useful cor treating disorders asociated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions, skin diseases asociated with the preservation and maintenance differentiation (e.g. psoriasis). Parkinson's disease, lamyotrophic lateral scherosis (ALS), neuropathies and differentiation (e.g. psoriasis). Parkinson's disease, lamyotrophic lateral scherosis (ALS), neuropathies and activation additionally, disease related to uncontrolled cell growth, e.g. cancer. PRO polypeptides also serves as tunour specific antigens which may be exploited as therapeutic latered to uncontrolled cell growth, e.g. cancer. PRO polypeptides also serves as tunour specific antigens which may be exploited as therapeutic targets for anti-tumour drugs, and are also cantibrombots as therapeutic argets for anti-tumour drugs, and are also cantibrombots as therapeutic associated disorders as compared with hepatin, in treating other PRO-associated disorders, in modulating of endomerrial bleedings and their portions affect on kidney tissue, PRO polypeptides, and may also have an effect on kidney discuss mother have a role in apoptosis. The polymolectides are useful in molecular biology including uses as hybridisation of antisense RNA and but conscend and spen mapping, in the generation of antisense RNA and the conscense and gene mapping, in the generation of antisense RNA and conscipled the protein and for chromosome and gene mapping, in the generation of antisense RNA and the resemble protein and for chromosome and gene mapping, in the generation of artisense resemble

Novel isolated secreted and transmembrane PRO polypeptide, useful for tissue typing, treating Parkinson's disease, Alzheimer's disease, birth defects, cancer.

Claim 2; SEQ ID NO 262; 464pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antithedies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a call expressing a PRO polypeptide, for modulating a contective molecule to a call expressing a PRO polypeptides are useful to redecting other PRO polypeptides in a sample and for linking a colypeptide antibodies are useful for modulating the biological activity of a call expressing a PRO polypeptides. The PRO polypeptide antibodies are useful for modulating the biological activity of a call expressing which has promain a sample and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal festing disorders associated with haboramal keratinocyte of gastrointestinal mucosa and the repair of acute and chronic mucosal diseases, amyotrophic lateral sclerosis (ALS), neuropathies and cancer. Consolvated as therapeutic targets for anti-tumour drugs, and are also exploited as therapeutic targets for anti-tumour drugs, and are also exploited as therapeutic targets for anti-tumour drugs, and are also capped propertion. The PRO polypeptides can be also used in assays to determine if it has a role in neurodegenerative diseases or their reversal, as an antibenting and other PRO-associated disorders, in modulating endommerrial bleeding anglogenesis, and may also have an effect on kidney tissue. PRO polypeptides and their portions affect the expression of

genes which have a role in apoptosis. The polymucleotides are useful in molecular biology including uses as hybridisation probes for cDNA library choisolate the full-length PRO cDNA or to isolate other CDNAs, in chromosome and gene mapping, in the generation of antisense RNA and DNA, for preparing PRO polypeptides, for generating transgenic animals or knockout animals which are useful in the development and screening of therappeutically useful reagents, in the development genetic analysis of individuals with genetic disorders as well as for recombinantly expressing the protein and for chromosome identification. The proteins are useful as molecular marker for protein electrophoresis purposes, as the PRO polypeptide (aponists) or protein electrophoresis purposes, the PRO polypeptide (aponists) or protein electrophoresis purposes that mimic the PRO polypeptide (aponists) or protein electrophoresis schaul proteins are useful for tissue typing. PRO antibodies are useful for tissue typing. PRO antibodies are useful for immunohistochemical diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affanity purification of PRO from tecombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              14-SEP-1998
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             31-OCT-:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        28-OCT-
       The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The polypeptides are useful for detecting PRO polypeptides and for linking a bioactive molecule to a cell expressing the polypeptides, where the bloactive molecule to a cell expressing the polypeptides. The bioactive molecule is a toxin, radiolabel or an antibody. The bioactive material causes the death of the cell. The polypeptides or antibodies specific to the polypeptides are useful for modulating at least one biological activity of a cell expressing the polypeptides. The collypeptides are useful for treating disorders associated with leukocyte coloning such as asthma, rheumatoid arthritis, psoriasis and multiple colonings such as asthma, rheumatoid arthritis, psoriasis and multiple colonicitis and Zollinger Ellison syndrome and for identifying agonists or antagonists of the polypeptides. The polymucleotides are useful as hybridization probes, in chromosome and gene mapping, in generating of antisense RNA and DNA, in the preparation of PRO polypeptides and for generating probes for polymerase chain reaction (PCR), Northern analysis, and molonial and plant analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   itttererararakierrakiekiririrakeerarirerakeeereeeeekerareri 1331

Ashkenazi A, Botstein D, Desnoyers L, Eaton DL, Ferrara N; Filvaroff E, Fong S, Gao W, Gerber H, Gerritsen ME, Goddard A; Godowski PJ, Grimaldi JC, Gurney AL, Hillan KJ, Kljavin IJ; Mather JP, Pan J, Paoni NF, Roy MA, Stewart TA, Tumas D; Williams PM, Wood WI;

WPI; 2003-765399/72. P-PSDB; ADB77789 New isolated secreted and transmembrane polypeptide, useful for treating diseases, e.g. Parkinson's disease, Alzheimer's disease, amyotrophic lateral sclerosis, cancer, neuropathies, diabetes and psoriasis.

Claim 2; Fig 97; 467pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antitudedies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protean and for linking a the least one biological activity of a cell. PRO polypeptides are useful conditions at least one biological activity of a cell. PRO polypeptides are useful bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing a PRO polypeptides are also useful for treating disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions, skin diseases associated with abnormal keratinocyte of gastrointestinal mucosa and the repair of acute and chronic mucosal differentiation (e.g. psoriasis), Parkinson's disease, Alzheiner's diseases, amyotrophic lateral sclerosis (ALS), neuropathics and acuter. PRO polypeptides also serves as tumour specific antigens which may be exploited as therapeutic targets for anti-tumour drugs, and are also exploited as role in neurodesencrative diseases or their reversal, as an infection. The PRO polypeptides can be also used in assays to determine if the has a role in neurodesencrative diseases or their reversal, as an antithrombotic agent with reduced risk for haemorrhage as compared with heparin, in treating other PRO-associated disorders, in modulating cendometrial bleeding angiogenesis, and may also have an effect on kidney tissue. PRO polypeptides an apoposis. The polymotleetides are useful in molecular biology including uses as hybridisation probes for CDNA library

```
c to isolate the full-length PRO cDNA or to isolate other cDNAs, in chromosome and gene mapping, in the generation of antieense RNA and DNA, for preparing PRO polypeptides, for generating transgenic animals or knockout animals which are useful in the development and screening of therapeutically useful reagents, as probes and for the generic analysis of individuals with genetic disorders as well as for recombinantly expressing the protein and for chromosome identification. The proteins are useful as molecular marker for protein electrophoresis purposes, as the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (antagonists). The polynucleotides and proteins are useful for infamunohistocohemical for itssue typing. PRO antibodies are useful for immunohistocohemical cataining and/or assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The ending entering its a gene encoding a PRO polymucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

Claim 2; Fig 97; 475pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleid and encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide for inhking a carie demoding them. The PRO polypeptide in the specifically bind to the PRO polypeptide for inking a telest one belongical activity of a cell. PRO polypeptide are useful for modulating the biological activity of a cell. PRO polypeptide are as also useful for detecting other PRO polypeptides. PRO polypeptide are as also useful for treating disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of actue and chronic mucosal fifferentiation (e.g. psoriasis) Parkinson's disease, Altheimer's diseases ascociated with abnormal keratinocyte (c.g. psoriasis) Parkinson's disease, Altheimer's diseases are received with the preservation and maintenance of gastrointestinal mucosa and the repair of actual properties of gastrointestinal macosa activity of seases. As a character of the properties of the properties of gastrointestinal macosa activity of seases. As a character of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the properties of the prop

nvention.

```
The invention discloses isolated PRO secreted/transmembrane polypeptides and the nutolated and encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a call expressing a PRO polypeptide. For linking a to bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide and for modulating the bioactive molecule to a cell expressing a PRO polypeptides or useful for modulating the biological activity of polypeptides or polypeptide are useful for modulating the biological activity of polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypept
Novel secreted and transmembrane polypeptides and polynucleotides encoding them useful for treating skin, neurodegenerative diseases, as an antithrombotic agent and for inducing endothelial cell apoptosis.
                                                                                          Claim 2; SEQ ID NO 262; 470pp; English.

an Novel secreted and transmembrane polypeptides and polynucleotides encoding them useful for treating skin, neurodegenerative diseases, as antithrombotic agent and for inducing endothelial cell apoptosis.

### Claim 2; SEQ ID NO 262; 477pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bloactive molecule to a cell expressing a PRO protein and for linking a taleast one biological activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a bloactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or polymorlecides are useful for simulating hypertrophy of neonatal heart, inhibiting vascular endothelial growth factor (VEGF)-stimulated proliferation of endothelial cells, modulating the proliferation of stimulated retinulated T-lymphocytes, enhancing the survival or proliferation of stimulating the proliferation of stimulating the proliferation of stimulating the proliferation of stimulating the proliferation of stimulating the proliferation of stimulating the proliferation of stimulating the proliferation of stimulating the proliferation of stimulating the proliferation of stimulating proliferation and/or receips.

```
cc differentiation of chondrocytes. In particular, these are useful for detecting or treating cardiac insufficiency disorders, wounds, cancerous tumours, retinal disorders or injuries (e.g. 169s of sight due to retinitis pigmentosum), obesity, diabetes, hyperinsulinaemia, hypothsulinaemia, or bone or cartilage disorders (e.g. sports injuries or arthritis) in mammals. PRO polypeptides and their portions affect the expression of genes which have a colle in cell death. The polytuclectides are useful in molecular biology including uses as hybridisation probes of for cDNA library to isolate the full-length PRO cDNA or to isolate other cDNAs, in chromosome and gene mapping, in the generating transgenic and minals which are useful in the development and comminals or knockout annimals which are useful in the development and screening of therapeutically useful reagents, as probes and for the genetic analysis of individuals with genetic disorders as well as for coroninantly expressing the protein and for chromosome identification. The proteins are useful as molecular marker for protein electrophoresis uproposes, as therapeutic agents, for screening compounds to identify the PRO polypeptide (antagonists). The polymucleotides and proteins are useful for tissue typing. PRO antibodies are useful for distinct of the PRO polypeptide (antagonists). The polymucleotides and proteins are useful in diagnostic assays of sample fluids. Anti-PRO expression in specific cells, tissues or serum and for affinity or replacing a defective gene may also be used in gene therapy, particularly for replacing a gene encoding a PRO polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   2983 ICTATITIACTITAATIGCACTIATITITIATIGATITITICIAATAAAATCCAGTCCTIGT 3042

Novel secreted and transmembrane polypeptides and polynucleotides encoding them useful for treating skin, neurodegenerative diseases, as an antithrombotic agent and for inducing endothelial cell apoptosis.

### Claim 2; SEQ ID NO 262; 473pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides on the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a contibodies that specifically bind to the PRO polypeptide in a sample and for modulating at least one bloiogical activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a bloadcale to a cell expressing a PRO polypeptides in a sample and for linking a bloadcate medicule to a cell expressing PRO polypeptides. The PRO polypeptides are useful sparmaceuticals, diagnostics, pices are useful as pharmaceuticals, diagnostics, biosensors or polymedicating versions. These are useful for stimulating hypertrophy of meantal nearth in a cell expressing PRO polypeptides. The PRO polypeptides or boreactors. These are useful for stimulating hypertrophy of meantal colls, induction of endothelial growth factors (VEFF) estimulated colls, modulating the proliferation of for for the proliferation of endothelial growth factors (VEFF) estimulated colls, modulating glucose or FFA uptake, inducing proliferation of endothelial growth factors are useful for cells, modulating glucose or FFA uptake, inducing proliferation of endothelial growth are cells, inducing proliferation and/or retrinitis pigmentosum), obesity, diabetes, hyperinsulinaemia, or bone or cartilage disorders, wounds, cancerus crimitis pigmentosum), obesity, diabetes, hyperinsulinaemia, or bone or cartilage disorders, sprokes and profession of genes which have a role in cell death. The polymucleotides con by polymential biology including uses as hybridisation probes (CC or oDNA library to isolate the full-length PRO oDNA or to isolate other and plans, in chromosome and gene mapping, in the generation of thraspeutically useful in manuals which are useful in the development and creaming of thraspeutically useful as molecular marker for protein electrophoresis contends are useful for tissed the proteins are

expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The RRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a gene encoding a PRO polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; gene; ss; PRO; secreted; transmembrane; therapeutic; tissue typing; immunohistochemical staining; gene therapy; neconatal heart; vascular endothelial growth factor; VEGF; proliferation; endothelial cell; stimulated T-lymphocyte; retinal neuron; rod photoreceptor cell; c-fos; glucose; FFA; chondrocyte; cardiac insufficiency disorder; wound; cancer; tumour; retinal disorder; retinitis pigmentosum; obesity; diabete; hyperinsulinaemia; hypoinsulinaemia; bone disorder; cartiade disorder; sport injury; arthritis; cardiant; vulnerary; cytostatic; ophthalmological; osteopathic; antiarthritic; anorectic.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides on be used to raise antibodies that specificially bind to the PRO polypeptide, for linking a cariabodise that specificially bind to the PRO polypeptide for inking a transmembrane polypeptide. For Inking a transmembrane polypeptide antibodies are useful for modulating the biological activity of a cell PRO polypeptides. The PRO polypeptide antibodies are useful for modulating the biological activity of conference. The PRO polypeptides or polymorecents are useful for modulating the biological activity of conferences. The PRO polypeptides or polymorecents. The PRO polypeptides or polymorecents. The PRO polypeptides or polymorecents. The properties of a cell expressing PRO polypeptides. The PRO polypeptides or polymorecents. The PRO polypeptides or polymorecents. The PRO polypeptides or polymorecents. The properties of a cell expressing PRO polypeptides. The PRO polypertrophy of meonatal heart. Inhibiting vascular endothelial growth factor (VEGP)-stimulated proliferation of endothelial cells, modulating pulcose or FPA uptake, inducing proliferation of chondrocytes. In particular, these are useful for cells, modulating glucose or FPA uptake, inducing proliferation of disorders or inputies (e.g. loss of sight due to differential disorders or inputies (e.g. loss of sight due to cerinitis prigmantomy or bossity, diabetes hyperinsulary prolymorecents the properties or inputies (e.g. sports minarial or genes which have a role in cell for sometime of antisense RNA hypoisusulates or processor or polymorecents or control of second or second properties or entities of the properties or entities or second properties or entities of the properties or entities with generation of sense as hybridisation properties or subalized with generation of sense and properties are useful in diagnostic assays for Processor or interpolation of properties are useful in diagnostic assays for process, as therapeutically usef
                                                                                                                                                Novel secreted and transmembrane polypeptide for modulating biological activity of cell expressing the polypeptide, identifying agonists or antagonists of polypeptide, and as molecular weight markers.

Novel secreted and transmembrane polypeptides and polynucleotides encoding them useful for treating cancers, asthma, rheumatoid arthritis, neurological diseases, and skin diseases.

## Claim 2; SEQ ID NO 262; 478pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or

```
polymuclectides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These are useful for stimulating hypertrophy of neonatal heart, inhibiting vascular endothelial growth factor (VEGF)-stimulated proliferation of endothelial cells, modulating the proliferation of stimulated T-lymphocytes, enhancing the survival or proliferation of retinal neurons or rod photoreceptor cells, inducing proliferation and/or recinal neurons or rod photoreceptor cells, inducing proliferation and/or reding glucose or FRA uptake, inducing proliferation and/or reding glucose or FRA uptake, inducing proliferation and/or reding glucose or red uptake, inducing proliferation and/or reding flow of chondrocytes. In particular, these are useful for cells, inducing of chondrocytes in particular, these are useful for retinitis pigmentosum) obesity, diabetes, hyperinsulinaemia, manals. PRO polypeptides and their portions affect the articular printing in mammals. PRO polypeptides and their portions affect the are useful in molecular biology including uses as hybridisation probes for constant in molecular biology including uses as hybridisation probes for one printing and play, for preparing PRO polypeptides, for generation of antisense RNA and DNA, for preparing PRO polypeptides, for generation of antisense RNA and DNA, for preparing PRO polypeptides, for generation of antisense RNA and DNA, for preparing PRO polypeptides, so probes and for the commands or knockout animals which are useful in the development and for chromosome that mimic the PRO polypeptide (agonists) or prevent the effect of the proteins are useful as molecular marker for protein electrophoresis or useful for tissue typing. PRO polypeptide (agonists) or prevent the effect of immunohistochemical staining and/or assay of sample fluids. Anti-PRO antibodies are useful in agentification of PRO from recombinant cell culture or natural sources. The PRO polypeptide of the invention.

PRO properses, are useful as general properses or serum and for affinity and general p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                2983 TCTATITIACTITAATIGCACTTATITITITATIGATITITICIAATAAATCCAGTCCTTGT 3042

Novel isolated PRO polypeptides e.g. PRO234 (useful for treating rheumatoid arthritis, psoriasis and multiple sclerosis) and PRO187 (useful for treating Alzheimer's disease, cancer).

Claim 2; SEQ ID NO 262; 451pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise and the nucleic acid encoding them. The polypeptides can be used to raise articodies that specifically bind to the PRO polypeptides, for linking a bloactive molecule to a cell expressing a PRO polypeptides are useful for modulating a bloactive molecule to a cell expressing a PRO polypeptides are useful complement of a cell expressing a properties are useful as properties. The PRO polypeptides are useful as plantaceuticals, diagnostics, blosensors or polymented antibodies are useful for modulating the biological activity of a cell expressing a properties. The PRO polypeptides or polymented are useful as pharaceuticals, diagnostics, blosensors or polymented are useful for stimulating hypertrophy of meonatal heart, inhibiting vascular endothelial growth factor (VEGF)-stimulated proliferation of endothelial cells, modulating the proliferation of endothelial cells, inducing proliferation of endothelial cells, inducing proliferation and/or retinal neurons or rod photoreceptor cells, inducing proliferation and/or recing or treating cardiac insufficiency disorders, wounds, cancerous cumours, retinal disorders or injuries (e.g. loss of sight due to detecting or treating cardiac insufficiency disorders, soports injuries or arthritis planents, or bone or cartilage disorders (e.g. sports injuries or arthritis) in mammals. PRO polypeptides, and their portions affect the expression of genes which have a role in cell death. The polymucleotides are useful in molecular biology including uses as hybridisation probes or conval biology including uses as hybridisation of antimals or knockout animals which are useful in the generation of antisce construction of herspectual procession of penes which have a role energing of therspectuals which are useful in the generation of or the general or recombinantly expressing the protein and for chromosome and gene which are useful energing of thers

The proteins are useful as molecular marker for protein electrophoresis purposes, as therapeutic agents, for screening compounds to identify those that mimic the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (antagonists). The polymoteotides and proteins are useful for tissue typing. PRO antibodies are useful for mimurohistochemical staining and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The progress may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a gene encoding a PRO polymucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           tissue typing; immunohistochemical staining; gene therapy; neonatal heart; vascular endothelial growth factor; VEGF; proliferation; endothelial cell; stimulated T-lymphocyte; retinal neuron; rod photoreceptor cell; c-fos; glucose; FFA; chondrocyte; cardiac insufficiency disorder; wound; cancer; tumour; retinal disorder; retinitis pigmentosum; obesity; diabete; hyperinsulinaemia; hypoinsulinaemia; hone disorder; cartilage disorder; sport injury; arthritis; cardiant; vulnerary; cytostatic; ophthalmological; osteopathic; antiarthritic; anorectic.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides cone bused to raise and the nucleic acid encoding them. The polypeptide to raise antibodies that specifically bind to the PRO polypeptide. For linking a bloactive molecule to a cell expressing a PRO polypeptide. The PRO Discrete in the SPO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides of a cell expressing PRO perpeptides in PRO PRO PROPERTIES. The PRO PRO PROPERTIES of a cell expressing PRO polypeptide antibodies are useful for modulating the biological activity of polypeptide antibodies are useful for modulating the proliferation of proceedors. These are useful for the survival or proliferation of colymolocytes, enhancing the survival or proliferation of retinal neurons or rod photoreceptor cells, inducing c-fcs in endothelial cells, modulating proliferation of condroverses. In particular, these are useful for cells, modulating proliferation of chondrocytes. In particular, these are useful for cells, modulating proliferation of chondrocytes. In particular, these are useful for cells, modulating proliferation of chondrocytes. In particular, these are useful for cells, modulating proliferation of chondrocytes. Inducing proliferation of chondrocytes. Inducing proliferation of chondrocytes. Inducing proliferation probes cumours, retinal disorders or injuries (e.g. loss of sight due to cells, modulating plucose or FRA uptake, inducing proliferation probes constitution of genes which have a role incells, modulating proliferation of genes which have a role incell proliferation of genes which have a role incell proliferation of genes which have a role incell proliferation of genes which have a role incell proliferation of genes which have a role incell proliferation of the rapeutically useful reagents, as probes and for the combinantly expressing the protein and engagents, as therapeutically useful reagents, 
                                                                                                                                                                                                                                                                                                                                                                                    Novel secreted and transmembrane polypeptides and polynucleotides encoding them useful for treating skin, neurodegenerative diseases, as an antithrombotic agent and for inducing endothelial cell apoptosis.

2003-708343/67. P-PSDB; ADC40880 Novel PRO polypeptides useful for treating Parkinson's disease, Alzheimer's disease, enterocolitis, Zollinger-Ellison syndrome, psoriasis, epidermoid carcinoma of the vulva and gliomas, gynecological diseases.

Claim 2; SEQ ID NO 262; 473pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides

can the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bloactive molecule to a cell expressing a PRO potypeptide are useful conflored and the specifically bind to the PRO polypeptides are useful conflored and polypeptides are useful as phanneculicals, diagnostics, biosensors of a cell expressing PRO polypeptides. The PRO polypeptides or conflored antibodies are useful for mediating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or conflored are useful as phanneculicals, diagnostics, biosensors or bioreactors. These are useful for stimulating hypertrophy of mediating the biological activity of proliferation of endothelial cells, modulating hypertrophy of mediating conflored to proliferation of endothelial cells, modulating che proliferation of endothelial cells, modulating proliferation of endothelial cells, modulating proliferation of conflored cells, modulating proliferation of conflored cells, modulating diucose or FPA upper cells, inducing cries in endothelial cells, modulating proliferation of conflored cells, modulating processor or injuries (e.g., post significantion of conductorial cells, modulating proliferation of conductorial conflored cells, hyperingulation of conductorial cells, modulating of conductorial cells, modulating carried in an endothelial cells, modulating carried conflored cells, hyperingulation of genes which have a role in cell death. The polypoints diagnostics in mannals. PRO polypeptides and their portions affect the are useful in molecular biology including uses as hybridisation probes for convenient and some mapping, in the development and conflored cells, mannals or knockout animals which have a role in cell death. Ashkenazi A, Botstein D, Desnoyers L, Eaton DL, Ferrara N, Filvaroff E, Fong S, Gao W, Gerber H, Gerritsen ME, Goddard A, Godowski DJ, Grimaldi JC, Gurney AL, Hillan KJ, Kljavin IJ; Mather JP, Pan J, Paoni NF, Roy MA, Stewart TA, Tumas D; William PM, Wood WI,

WPI; 2003-695902/66. P-PSDB; ADC19537. Novel isolated PRO polypeptide useful for treating Parkinson's disease, enterocolitis, Zollinger-Ellison syndrome, gastrointestinal ulceration, Alzheimer's disease, amyotrophic lateral sclerosis.

### Claim 2; SEQ ID NO 262; 478pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise can tabedies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful cor documents as ample and for modulating a bioactive molecule to a cell expressing a PRO polypeptide are useful cor modulating the biological activity of a cell expressing PRO polypeptide and for linking a collocative molecule to a cell expressing a PRO polypeptide or inking a collocative molecule are useful as pharmaceuticals, diagnostics, biosensors or collocators. These are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or polymucleotides are useful for stimulating hypertrophy of neonatal collocations. These are useful for colliferation of endothelial cells, modulating the proliferation of stimulated T-lymphocytes, enhancing the survival or proliferation of cells, modulating proliferation of cells, modulating proliferation of cells, modulating proliferation of cells, modulating processor PRA uppake, inducing proliferation and cells, modulating proliferation and chondrocytes, in particular, these are useful for cells, modulating or treating cardiac insufficiency disorders, wounds, cancerous cumours, retinal disorders or injuries (e.g. sports injuries or retinitis pigmentcaum), obesity, diabetes, hyperingulinaemia, or bone or cartilage disorders (e.g. sports injuries or arthitis) in mammals. PRO polypeptides and their portraions affect the expression of genes which have a roll dienthy proliferation of cholypeptides.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .8-NOV-1997
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        03-NOV-1997
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        29-OCT-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            07-NOV-1
       are useful in molecular biology including uses as hybridisation probes for cDNA library to isolate the full-length PRO cDNA or to isolate other CDNA, in chromosome and gene mapping, in the generation of antisense RNA can DNA, for preparing PRO polypeptides, for generating transgenic animals or knockout animals which are useful in the development and screening of therapeutically useful reagents, as probes and for the genetic analysis of individuals with genetic disorders as well as for recombinantly expressing the protein and for chromosome identification. The process, as therapeutic agents, for screening compounds to identify those that mimic the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (antagonists). The polynucleotides and proteins are useful for tissue typing. PRO antibodies are useful for immunohistochemical staining and/or assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a gene encoding a PRO to presented is a gene encoding a PRO plynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2983 TCTATTTTACTTTAATTGCACTTATTTTATTGATTTTTCTAATAAAATCCAGTCCTTGT 3042

RESULT 77 ADC13054 셤 ઠે The invention discloses isolated PRO secreted/transmembrane polypeptides and the mutolist acid encoding them. The polypeptides can be used to taise and the mutolist acid encoding them. The polypeptides for linking a can call with the properties and the modulating the bioactive molecule to a cell expressing a PRO polypeptide. The PRO bloactive molecule to a cell expressing a PRO polypeptides. The PRO polypeptides are useful for modulating the biological activity of polypeptide antibodies are useful for modulating the biological activity of polypeptide antibodies are useful for modulating the biological activity of polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or polymolocities are useful for stimulating hypertrophy of mechanic beart, inhibiting vascular endothelial growth factor (VDEP) stimulated broceactors. These are useful for stimulating hypertrophy of mechanic cells, modulating glucose or FRD works, inducing proliferation of retinal neurons or rod photoreceptor cells, inducing c-fos in endothelial endit for cells, modulating glucose or FRD works, inducing proliferation of chondrocytes. In particular, these are useful for cells, modulating glucose or FRD works, inducing proliferation of chondrocytes or insufficiency disporters, wounds, cancerous tumours, retinal disorders or injuries (e.g. loss of sight due to cells, modulating glucose or FRD works, inducing proliferation probes tumours, retinal disorders or injuries (e.g. loss of sight due to correct the proprint of antibody including uses as hybridisation probes tumours, retinal disorders or injuries (e.g. loss of sight due to correct the proprint of genes which have a role in cell for the proprint and proprints and provides and for the combinant or secondarial with generating transgenic corrections of therapeutically useful reagents, as probes and for the cecombinantly expressing the protain and for chromosome and genetic cells, module defecting and proprints are useful , Botstein D, Desnoyers L, Eaton DL, Ferrara N; Fong S, Gao W, Gerber H, Gerritsen ME, Goddard A; Grimaldi JC, Gurney AL, Hillan KJ, Kljavin IJ; Wood MI, Paoni NF, Roy MA, Stewart TA, Tumas D; wood MI; Novel isolated PRO polypeptides e.g. PRO245 and PRO1868, useful for treating e.g. Parkinson's disease, Alzheimer's disease, amyotrophic lateral sclerosis, cancer, neuropathies, diabetes and psoriasis. Claim 2; SEQ ID NO 262; 476pp; English. 22-FEB-2000; 2000WO-US004414.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specificially bind to the PRO polypeptide. for linking a cariotative for acid encoding them. The PRO polypeptide for mindoles that specificially bind to the PRO polypeptide. The PRO polypeptide in the PRO polypeptide are useful for acid encoding the PRO polypeptide in PRO polypeptide antibodies are useful for modulating the biological activity of a cell ** PRO polypeptide on the PRO polypeptide antibodies are useful for modulating the biological activity polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides of a cell expressing PRO polypeptides. The PRO polypeptides of a cell expressing PRO polypeptides. The PRO polypeptides of a cell expressing PRO polypeptides. The PRO polypeptides of a cell expressing PRO polypeptides. The PRO polypeptides of a cell expressing PRO polypeptides. The PRO polypetides of cells, modulating proliferation of conductoryes. In particular, inducing control proliferation of chocarcoytes. In particular, these are useful for cells, modulating plucose or FRV uptack, inducing proliferation of fhondrocytes. In particular, these are useful for cells, modulating plucose or FRV uptack, inducing proliferation of chocarcoytes. In particular, these are useful for cells, modulating clustering cardiac insufficiancy disorders, wounds, cancerous tumours, retinal disorders or injuries (e.g. sports injuries or articular or secondarion of annisense RNA proprisulinaemia, or bone or carrilage disorders, wounds, cancerous centing in proliferation of genes which have a role in cell and proliferation of genes which have useful in the development and construction of therapeutically useful reappets as a probes and for the genetic analysis of individuals with generating control and proved in parellal or modulary or process, as therapeutically useful reapports, or prevent an Novel isolated secreted and transmembrane PRO polypeptides e.g. PRO245 and PRO1868, useful for treating e.g. Parkinson's disease, Alzheimer's disease, amyotropic lateral sclerosis, cancer, neuropathies, diabetes and Claim 2; SEQ ID NO 262; 473pp; English. psoriasis. 

Sequence 1378 BP; 235 A; 461 C; 412 G; 270 T; 0 U; 0 Other;.

Gaps . 0 Query Match 0.7%; Score 24.6; DB 1; Length 1378; Best Local Similarity 53.7%; Pred. No. 26; Matches 51; Conservative 0; Mismatches 44; Indels 0;

WPI; 2003-743881/70. P-PSDB; ADC12507. New secreted transmembrane PRO polypeptides and nucleic acids encoding the polypeptides, useful in gene therapy, in identifying chromosomes, as chromosome markers, in generating probes and in tissue typing.

# Claim 2; SEQ ID NO 262; 487pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antithodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for inking a tileast one biological activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide are useful for modulating the biological activity of a cell expressing PRO polypeptides or polypeptides are useful for stimulating hypertrophy of neonacal polynucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These are useful for stimulating hypertrophy of neonacal heart, inhibiting vascular endothelial growth factor (VEGF) stimulated the tilefration of stimulated 1-lymphocytes, enhancing the survival or proliferation of stimulated retinal neurons or rod photoreceptor cells, inducing c-fos in endothelial

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9-0CT-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        17-NOV-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       03-NOV-
        cells, modulating glucose or FFA uptake, inducing proliferation and/or redifferentiation of chondrocytes. In particular, these are useful for detecting or treating cardiac insufficiency disorders, wounds, cancerous crumours, retinal disorders or injuries (e.g. loss of sight due to cretinitis pigmentosum), obesity, diabetes, hyperinaulinaemia, choose or injuries (e.g. loss of sight due to arthritis) in mammals. PRO polypeptides and their portions affect the expression of genes which have a role in cell death. The polymuclectides are useful in molecular biology including uses as hybridisation probes or commands in chromosome and gene mapping, in the generation of antisense RNA and DNA, for preparing PRO polypeptides, for generation of antisense RNA and DNA, for preparing PRO polypeptides, for generation of antisense RNA and DNA, for preparing PRO polypeptides, for generating transgenic commands or knockout animals which are useful in the development and screening of therapeutically useful reagents, as probes and for the correction and for chromosome identification. The proteins are useful as molecular marker for protein electrophoresis or prevent the effect of those that minit the PRO polypeptide (antagonists). The polymucleotides and proteins are useful for tissue typing. PRO antibodies are useful for mandomistochemical staining and/or assay of sample fluids. Anti-PRO expression in specific cells, tissues or serum and for affinity continued for membrohies are useful in diagnostic assay for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity or PRO genes may also be used in gene therapy, particularly for replacing a protyce polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1272 ITTTGIGTATATAAAGGTTAATGATTTTTATAGGTATTTGIAACCCTGCCCACATATCTT 1331

Novel isolated native PRO polypeptide useful for tissue typing, modulating biological activity of cell, as molecular weight markers in protein electrophoresis, for treating enterocolitis, Zollinger-Ellison syndrome.

# Claim 2; SEQ ID NO 262; 474pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the mucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO plypeptides are useful for detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide are useful for modulating the biological activity of a cell expressing a PRO polypeptides. The PRO polypeptide or linking a polypeptide are useful for modulating hypertrophy of neonatal complements. These are useful for stimulating hypertrophy of neonatal heart, inhibiting vascular endothelial growth factor (WEGF) stimulated CC proliferation of endothelial cells, modulating hypertrophy of neonatal complements. There are useful for stimulated T-lymphocytes, enhancing the survival or proliferation of complements. The survival or proliferation of detecting glucose or FRA uptack, inducing proliferation of colls, modulating glucose or FRA uptack, inducing proliferation of detecting of treating cardiac insufficiency disorders, wounds, cancerous cumulated T-lymphocytes, enhancing the survival or proliferation of detecting or treating cardiac insufficiency disorders, ensemble of the colls, inducing proliferation and or cartilage disorders, wounds, cancerous cumulation of theorems of artifactions of sight due to crimitis pigmentosum), obesity, diabetes, hyperinsulinaemia, or bone or cartilage disorders of engage as hybridisation probes or arthuring of thermanian, or bone or cartilage disorders of consecution of genes which have a role in cell death. The polymoched arthuring of thermanian properties and their portions affect the arthuring of thermanian properties and processed in decenting of thermanian properties and provesses, as therapeutic agents, for screening compounds to identify the proteins are useful an engelula m

```
antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a gene encoding a PRO polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                           1272 TTTTGTGTATATAAATGTTAATGATTTTTTATAGGTATTTGTAACCCTGCCCACATATCTT 1331

Novel isolated native PRO polypeptide useful for treating Parkinson's disease, enterocolitis, Zollinger-Ellison syndrome gastrointestinal ulceration, Alzheimer's disease, amyotrophic lateral sclerosis, Usher Syndrome.

Claim 2; SEQ ID NO 262; 487pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the mucleic acid encoding them. The polypeptides can be used to raise and the mucleic acid encoding them. The polypeptides for linking a bioactive molecule to a cell expressing a PRO polypeptide for modulating a bioactive molecule to a cell expressing a PRO polypeptide are useful for detecting other PRO polypeptides are useful for modulating the biological activity of a cell PRO polypeptides of the properties are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides of a cell expressing PRO polypeptides in a sample and for linking a confidence are useful for modulating the proliferation of polymentides are useful for modulating the proliferation of conducting the confidence of a cell expressing PRO polypeptides. The PRO polypeptides of polymentides or polymuclectides are useful for scientific properties or red photococceptor cells, modulating proliferation of conducting glucose or FRA uptack, inducing proliferation of chonduccytes. Enaminated or red photococceptor cells, modulating proliferation of chonduccytes. In particular, these are useful for cells, modulating proliferation of chonduccytes. In particular, these are useful for cells, modulating proliferation of chonduccytes. In particular, these are useful for cells, modulating plucose or FRA uptack. Inducing proliferation of chonduccytes or injuries (e.g. loss of sight due to creinitis pigmentosum), obesity, diabetes hyperitacis in molecular bloody including uses as hybridisation probes or retinitis pigmentosum, or bone or cartilinge disorders wunds, cancerous retinitis pigmentosum, or bone or cartilinge and their portions affect the combas, in chromosome and gene mapping, in the generation of annisens RNA minic the inforduction of solate the full-ingeth RNA in thromosome and gene mapping, in the generation of the red in the process of the process of the process of the process of the process of the process of the process of the p

```
The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel isolated native PRO polypeptide useful for tissue typing, modulating biological activity of cell, as molecular weight markers in protein electrophoresis, for treating enterocolitis, Zollinger-Ellison
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ashkenazi A, Botstein D, Desnoyers L, Eaton DL, Ferrara N; Filvaroff E, Fong S, Gao W, Gerber H, Gerritsen ME, Goddard A; Godowski DJ, Grimaldi JC, Gurney AL, Hillan KJ, Kljavin IJ; Mather JP, Paoni NF, Roy MA, Stewart TA, Tumas D; Williams PM, Wood WI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 2; SEQ ID NO 262; 472pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           10-SEP-1998
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  29-0CT-1997
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            24-NOV-1997
                                                                                                                                                                                                                                                                                                                                    17-SEP-1997
17-SEP-1997
for detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a RPO polypeptide. The PRO polypeptide antibodical activity of bioactive molecule to a cell expressing the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or considerable are useful as pharaceuticals, diagnostics, biosensors or bioreactors. These are useful for stimulating hypertrophy of meanal consideration of endothelial growth factor (VBGP)-stimulated proliferation of endothelial growth factor (VBGP)-stimulated proliferation of endothelial growth factor (VBGP)-stimulated proliferation of endothelial growth factor (VBGP)-stimulated collis, modulating glucose or FRA uptake, inducing proliferation of fordatoryes. In particular, these are useful for elinal neurons or rod photoreceptor cells, inducing proliferation of chordrocytes. In particular, proliferation and/or rectinal neurons or rod photoreceptor cells, inducing proliferation of chordrocytes. In particular, proliferation and/or cells, modulating glucose or FRA uptake, inducing proliferation of chordrocytes. In particular, proliferation and/or cells, modulating glucose or cartilage disorders, wounds, cancerous cummunities of some or cartilage disorders (e.g. joss of sight due to rethinist planemia, or bone or cartilage disorders (e.g. sports injuries or rethinitis) in molecular biology including uses as hybridistation probess for cDNA library to isolate the full-length PRO cDNA or to isolate other CDNAs, in chromosome and gene mapping, in the generation of antisense RNA animals without are useful in the development and screening of therapeutically useful reagents, as probes and for the generation of therapeutically useful reagents, as probes and for the genetic analysis of individuals with genetic disorders as well as for the proteins are useful as molecular marker for protein strengent or specific and produces, as therapeutic agents, for screening compounds to identify the proteins are useful in diagnostic assays for P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2983 TCTATTTTACTTTAATTGCACTTATTTTTATTGATTTTTCTAATAAATCCAGTCCTTGT 3042

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise can intiodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating a confident that specifically upperides in a sample and for linking a conformation other PRO polypeptides in a sample and for inking a conformation other PRO polypeptides are useful conformation for linking a conformation of a cell expressing a PRO polypeptides or conformation of a cell expressing a PRO polypeptides or conformation of a cell expressing a properties or conformation of a cell expressing a properties or conformation of solvential as pharmaceuticals, diagnostics, biosensors or polymucleotides are useful for simulating hypertrophy of neonatal conformation of endothelial growth factor (VEGP)-stimulated proliferation of conformation of stimulated T-lymphocytes, enhancing the survival or proliferation of stimulated T-lymphocytes, enhancing the survival or proliferation of conformation of conformation of conformation of conformation of chondrocytes. In particular, these are useful for cells, modulating glucose or FPA uptake, inducing proliferation and/or reciting or treating cardiac insufficiency disorders, wounds, cancerous cumpurs, retinal disorders or injuries (e.g. loss of sight due to rethintis pigmentosum), obesity, diabetes, hyperinsulinaemia, or bone or cartilage disorders (e.g. sports injuries or arthritis) in mammals. PRO polypeptides and their portions affect the expression of genes which have a role in cell death. The polymucleorides conformation of molecular biology including uses as hybridisation probes for conformation and gene mapping, in the generation of antisense RNA and DNA, for preparing PRO polypeptides, for generating transgenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ferrara N;

```

animals or knockout animals which are useful in the development and screening of therapeutically useful reagents, as probes and for the genetic analysis of individuals with genetic disorders as well as for recombinantly expressing the protein and for chromosome identification. The proteins are useful as molecular marker for protein electrophoresis purposes, as therapeutic agents, for screening compounds to identify those that mimic the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (agonists). The polymucleotides and proteins are useful for tissue typing. PRO antibodies are useful for immunohistochemical staining and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant coll culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a collumnicative gene and procession as a sequence of presented is a gene encoding a PRO 2983 ICTAITITACTITAATIGCACTIATITITATIGATTITICTAATAAATCCAGTCCTIGT 3042 1272 irringigiararaaangrraangaririnahaggraringraaccergcccacararerr 1331 Human; gene; ss; PRO; secreted; transmembrane; therapeutic; tissue typing; immunohistochemical staining; gene therapy; beneatal heart; vascular endothelial growth factor; VEGF; proliferation; endothelial cell; stimulated T-lymphocyte; retinal neuron; rod photoreceptor cell; c-fos; glucose; FFA; chondrocyte; cardiac insufficiency disorder; wound; cancer; tumour; retinal retinitis pigmentosum; obesity; diabete; hyperinaulinemia; hypoinsullinaemia; hone disorder; cartilage disorder; sport injury; arthritis; cardiant; vulnerary; cytostatic; ophthalmological; osteopathic; antiarthritis; anorectic. New nucleic acid encoding a PRO polypeptide, for producing a recombinant PRO polypeptide and for treating e.g. cancer, infertility, kidney disorders, and cardiac disfunctions.

# Claim 2; SEQ ID NO 262; 473pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide. For linking a bloactive molecule to a cell expressing a PRO polypeptide. For linking a bloactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptides are useful for modulating the biological activity of a cell. PRO polypeptides are useful for modulating the biological activity of a cell. PRO polypeptides or linking a propagation of the processing PRO polypeptides. The PRO polypeptides or linking a propagation of a cell expressing PRO polypeptides. The PRO polypeptides or the process of a cell expressing PRO polypeptides. The PRO polypeptides or polymucleotides are useful for modulating the proliferation of polymeropy or neonateral beart inhibiting vascular endochalial growth factor (VBGP) estimulated proliferation of condothelial cells, modulating the proliferation of chondrocytes. Inhuriting proliferation of chondrocytes. Inhuriting proliferation of chondrocytes. Inhuriting proliferation of chondrocytes. Inhuriting proliferation of chondrocytes. Inhurities proliferation of chondrocytes. Inhurities proliferation of chondrocytes. Inhurities or retinities pigmentosum), obesity, dishetes, hyperities, are useful for expression of genes which have a role in cell propried the control of antisense or extrating propried and their portions affect the arbitries provided the propression of genes which have a role in cell of sorters or inhurities (e.g. sports injuries or control of sorters or broad or carrilage disorders wounds, cancerved to control of sorters or propried in the development and sorten broad the properties of the properties are useful in the development and content and bub, to preparating PRO polypeptides, for generation of antisense RNA combinantly versesing the protein and for control in the development and second properties are useful in diagnostic assays for PRO e.g. detecting its econ

The invention discloses isolated PRO secreted/transmembrane polypeptides and the mucled caid encoding them. The polypeptides can be used too raise antibodies that specifically bind to the PRO polypeptide, for linking a bind the mucled caid encoding them. The polypeptides for modulating at a teast one biological activity of a cell. PRO polypeptides are useful for modulating the biological activity of a cell. PRO polypeptides are useful for similarial propertopes, biosensor of polypeptides are useful for similarial propertopes, biosensor or biological are useful for similarial propertopes, biosensor or biological are useful for similarial propertopes, biosensor or bioractors. These are useful for similarial propertopes, biosensor or bioractors. These are useful for similarial prover factor (VEGP)-stimulated propertopes, cancer or beart, inhibiting vascular endothelial growth factor (VEGP)-stimulated T-lymphocytes, enhancing the survival or proliferation of crimulated T-lymphocytes, enhancing the survival or proliferation of stimulated T-lymphocytes, enhancing the survival or proliferation of criminal neurons or robe propertor cells, inducing proliferation of criminal glorders or injuries (e.g. loss of sight due to differentiation of chondrovtes. In particular, these are useful for retaining cardiac insifficancy disorders, wounds, cancerous cumours, retinal sorders or injuries (e.g. loss of sight due to rethinitis pignemicsum), obesity, diabetes, hyperinsillinaemia, or bone or azarilage disorders (e.g. sports injuries or artilage disorders (e.g. sports injuries or expension of genes which have a role in cell death. The polymucleotides are useful in molecular biology including uses as hybridistation probes con the DNA, for preparing PRO polypeptides, for generating transgence or the processing the process and their portions and polymphase or induced analysis of individuals with genetic disorders as well as minerally expressing the procein marker for proteins are useful as molecular marker for proteins are useful as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 1378 BP; 235 A; 461 C; 412 G; 270 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  polynucleotide of the invention.

New nucleic acids encoding polypeptides designated PRO have sequence identity to various secreted proteins and transmembrane proteins and are useful in molecular techniques and as therapeutic agents.

# Claim 2; SEQ ID NO 262; 474pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful for modulating a pleactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptides are useful for modulating the biological activity of a cell expressing a PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing a PRO polypeptides or polypeptides are useful for stimulating the biological activity of a cell expressing PRO polypeptides or polymuclectides are useful for stimulating hypertrophy of neonatal colliferation of bioreactors. These are useful for stimulating hypertrophy of neonatal colliferation of endothelial cells, modulating the proliferation of stimulated T-lymphocytes, enhancing the survival or proliferation of conditions or relia, inducing c-fos in endothelial cells, modulating proliferation and/or recipieration of chondrocytes. In particular, these are useful for cells, inducing c-fos in endothelial cells, modulating orbitical cardiac insufficiency disorders, wounds, cancerous tumours, retinal disorders or injuries (e.g. loss of sight due to bypoinsulinaemia, or bone or cartilage disorders (e.g. sports injuries or hypoinsulinaemia, or bone or cartilage disorders (e.g. sports injuries or

carthritis) in mammals. PRO polypeptides and their portions affect the expression of genes which have a role in cell death. The polynucleotides are subtrained probes for connain in molecular biology including uses as hybridisation probes cor connain in molecular biology including uses as hybridisation probes con the connain in the connain and contained the propertial propertials. For generation of antisense RNA and DNA, for preparing PRO polypeptides, for generating transgenic continuals or knockcut animals which are useful in the development and screening of therapeutically useful reagents, as probes and for the screening of therapeutically useful reagents, as probes and for the screening of the protein and for chromosome identification. The proteins are useful as molecular marker for protein electrophoresis purposes, as therapeutic agents, for screening compounds to identify the PRO polypeptide (agonists). The polymucleotades and proteins are useful for tissue typing. PRO antibodies are useful for tissue typing. PRO antibodies are useful for tissue typing and/or assay of sample fluids. Anti-PRO immunohistochemical staining and/or assay for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity countification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a gene encoding a PRO polypeptide of the invention.
